Tubular Heaters

Tubular Heating Elements being filled with MgO insulating powder.

Tubular Heaters are the most versatile and widely used source of electric heat for industrial, commercial and scientific applications. They can be designed in a wide range of electrical ratings, diameters, lengths, terminations, and sheath materials. Important and useful characteristics of tubular heaters are that they can be formed into virtually any shape, brazed or welded to any metal surface, and cast into metals. Carefully researched manufacturing methods and quality materials have made Tempco tubular heaters stand apart from other heating elements claiming similar performance.

The cutaway view shows the tubular heater’s basic construction. A computer-designed helical coil of 80% Nickel 20% Chromium alloy resistance wire is fusion welded to the nickel-coated steel terminal cold pin. This coil assembly is precisely stretched and centered in the element metal sheath, which is then filled with Grade “A” Magnesium Oxide powder (MgO). The filled tube is then compacted by a roll reduction mill into a solid mass, permanently stabilizing the coil in the center of the tube while providing excellent heat transfer and dielectric strength between the coil and the sheath.

**Tubular Heater Introduction**

**Design Guidelines**

**Resistance Tolerance**

Tubular heating elements have an Industry Standard Resistance Tolerance of +10%, −5% which translates to a Wattage Tolerance of +5%, −10%. Consult Tempco if tighter tolerances are required for your application.

**Watt Density**

Element Watt Density is the wattage dissipated per square inch of the element sheath surface and is critical to the proper heating of the application and to the life expectancy of the heater. The Watt Density is calculated with the following formula:

\[
\text{Watt Density (w/in}^2\text{)} = \frac{\text{Element Wattage}}{\pi \times \text{Element Dia.} \times \text{Element Heated Length}}
\]

For a particular application element watt density will govern element sheath and internal resistance wire temperature. Factors to consider when choosing a suitable watt density are:

1. Many materials are heat sensitive and can decompose or be damaged if the element is running too hot.
2. Air and other gases that are poor conductors of heat require watt densities matched to the velocity of the gas flow to prevent element overheating.
3. When heating hard water or cleaning solutions, mineral deposits can build up on the element sheath, acting as a heat insulator and raising the internal element temperature. If these deposits cannot be periodically removed, use a lower watt density element to increase heater life expectancy.
4. When tubular heaters are used in UL recognized oil immersion heating applications the heated oil temperature cannot exceed 257°F (125°C). Steel sheath elements are limited to 60 watts/in². Tubular heaters with steel or stainless steel bulkhead fittings used in UL oil heating applications are not pressure rated. Contact Tempco for other application specific UL file information.
5. Page 16-12 in the Engineering Data Section of this catalog lists the maximum recommended heater watt density for many materials. For additional information and help please contact Tempco.

If you require UL, CSA, or other NRTL agency approvals, please specify when ordering.

**Important Note** — When heating any substance it is critical to match the heater watt density, operating temperature and sheath material to the specific medium being heated. Failure to do so will result in premature heater failure and/or unsafe conditions.

View Product Inventory @ www.tempco.com

**Typical Applications**

- Forced air heating
- Thermal forming machines
- Direct immersion in liquids
- Comfort radiant heaters
- Welded, brazed or clamped to tanks and pipes
- Hot runner molds
- Combination radiant and convection heater for ovens and dryers

**Construction Characteristics**

The cutaway view shows the tubular heater’s basic construction. A computer-designed helical coil of 80% Nickel 20% Chromium alloy resistance wire is fusion welded to the nickel-coated steel terminal cold pin. This coil assembly is precisely stretched and centered in the element metal sheath, which is then filled with Grade “A” Magnesium Oxide powder (MgO). The filled tube is then compacted by a roll reduction mill into a solid mass, permanently stabilizing the coil in the center of the tube while providing excellent heat transfer and dielectric strength between the coil and the sheath.

Tubular Heating Elements are certified as Recognized Components by Underwriters Laboratories (File Number E90771) under CCN UBJY2/8 to meet UL Standard UL1030. Tempco’s equivalent CSA File Number is 043099. Tubular elements with bulkhead fittings have also been certified for oil heating (File Number MP4154) under CCN MDST2/8 to meet UL Standard 574.

**Important Note** — When heating any substance it is critical to match the heater watt density, operating temperature and sheath material to the specific medium being heated. Failure to do so will result in premature heater failure and/or unsafe conditions.

View Product Inventory @ www.tempco.com
The selection of a sheath material should be made based on the chemical composition of the gas or liquid being heated, the characteristics of the materials entering the solution, and the processes controls. A material selection guide can be found on page 16-12.

**NOTE:** The best source for chemical/sheath compatibility is the supplier of the gas or liquid to be heated.

The following are the most common tubular element sheath materials. For other materials consult Tempco.

**Incoloy® 840:** Nickel 18-20%, Chromium 18-22%, Iron balance. Has about 10% less nickel than Incoloy 800. Used in many air heating applications, where it has exhibited superior oxidation resistance at less cost than Incoloy 800.

Maximum Sheath Temperature: 1600°F / 871°C

**Incoloy® 800:** Nickel 30-35%, Chromium 19-23%, Iron balance. The high nickel content of this alloy contributes to its resistance to scaling and corrosion. Used in air heating and immersion heating of potable water and other liquids.

Maximum Sheath Temperature: 1600°F / 871°C

**316 Stainless Steel:** Chromium 16-18%, Nickel 11-14%, Iron balance. Modified with the addition of Molybdenum (2-3%) to improve corrosion resistance in certain environments, especially those which would tend to cause pitting due to the presence of chlorides. Applications include deionized water.

Maximum Sheath Temperature: 1200°F / 649°C

**304 Stainless Steel:** Chromium 18-20%, Nickel 8-11%, Iron balance. Used in the food industry, medical, and chemical heating.

Maximum Sheath Temperature: 1200°F / 649°C

**321 Stainless Steel:** Chromium 17-20%, Nickel 9-13%, Iron balance. Modified with the addition of Titanium to prevent carbide precipitation and resulting intergranular corrosion that can take place in certain mediums when operating in the 800-1200°F (427-649°C) temperature range.

Maximum Sheath Temperature: 1200°F / 649°C

**Copper:** Standard Copper Alloy

A low temperature, inexpensive material used mainly for clean water heating.

Maximum Sheath Temperature: 350°F / 177°C

**Steel:** Low Carbon

Used for high to low viscosity oils, asphalt, tar, wax, molten salt, heat transfer liquid media and other compatible solutions.

Maximum Sheath Temperature: 750°F / 399°C

**Other Sheath Materials:** Available for a limited number of diameters. Consult Tempco for more information.

**Inconel® 600:** Iron 6-10%, Chromium 14-17%, Nickel balance

Maximum Sheath Temperature: 1800°F / 982°C

**Incoloy® 825:** Nickel 38-46%, Chromium 19.5-23.5%, Molybdenum 2.5-3.5%, Iron balance

Maximum Sheath Temperature: 1100°F / 593°C

**Maximum Sheath Temperature** refers to the maximum temperature of the element sheath material. Consideration must be given to the maximum temperature that can be safely applied to the heated material. See **Watt Density** on the previous page for additional information.

Sheath Treatments and Terminations

**Incoloy® and Stainless Steel Element Sheath Surface Treatments**

**Standard Surface Finish**
The standard tubular heater element surface finish is a black chrome oxide, produced when the element is annealed prior to forming in an exothermic atmosphere furnace.

**Optional Surface Finishes**

**Bright Annealing** is an option where the tubular heater is annealed in a dissociated ammonia atmosphere furnace. This produces a clean metallic appearance without surface-etching the sheath.

**Electro-Polishing** is an electrochemical process that removes surface imperfections and contaminants, enhancing the corrosion resisting ability of the sheath. The resulting surface is clean, smooth and has a bright finish; it is highly recommended for medical, food and other harsh applications.

**Passivation** removes surface contamination, usually iron, so that the optimum corrosion resistance of the stainless steel is maintained. Surface contamination could come from the small amount of steel that may be worn off a tool during the manufacturing process.

**Standard Tubular Heater Terminations**

Select the termination style that meets your requirements for space, accessibility and reliability.

**TYPE T—STANDARD**
Threaded stud terminal with ceramic insulator.

**TYPE SF & SF9 (90°)—Quick Connect**
1/4" male (3/16" optional) quick connect (slip-on) terminals are welded to the element terminal pin. They provide quick and easy installation of lead wire with excellent holding force. Specify if an optional mica or ceramic insulator is required. Material: Nickel-Plated Steel.

**TYPE L_ & L9_ (90°)—Terminal Lug**
A nickel-plated steel lug is projection welded to the terminal pin straight (Type “L_”) or at 90° to the sheath (Type “L9_”). Specify if an optional mica or ceramic insulator is required.

Standard LA, L9A 10-32 screw  Optional LB, L9B 8-32 screw

View Product Inventory @ www.tempco.com
**Tubular Heater Standard Terminations**

**TYPE E — Right-Angle Lug Terminal**

- **Type E1A**: 8-32 screw with mica insulator (Standard)
- **Type E1B**: 8-32 screw with ceramic insulator
- **Type E2A**: 10-32 screw with mica insulator
- **Type E2B**: 10-32 screw with ceramic insulator

**TYPE A — Right-Angle Terminal** (for use when space is tight)

- **Type A1A**: 8-32 screw with mica insulator
- **Type A1B**: 8-32 screw with ceramic insulator
- **Type A2A**: 10-32 screw with mica insulator
- **Type A2B**: 10-32 screw with ceramic insulator (Standard)

**TYPE F1 — Lead Wire**

When selecting a lead wire type, consideration should be given to the maximum ambient temperature the lead wire is exposed to and the environment it is in. Lead wire options Type R1 and W1 below will provide additional environmental protection to the Type F1 lead wire selected.

- **Type F1A**: 250°C (482°F) TGGT insulation
- **Type F1B**: 450°C (842°F) MGT insulation
- **Type F1C**: 200°C (392°F) Teflon® insulation
- **Type F1D**: 150°C (302°F) Silicone Rubber insulation
- **Type F1E**: 105°C (221°F) Thermoplastic (PVC) insulation

Standard 10” (254 mm) leads with fiberglass sleeve. Specify if other lead length is required.

F1C F1D & F1E available with optional heat shrink sleeving. Specify when ordering if required.

**Lead Wire Termination Options**

**TYPE R1 — Flexible Armor Cable**

- **Type R1A**: Galvanized cable
- **Type R1B**: Stainless steel cable

Provides excellent protection to lead wires in abrasive environments.

Standard 10” (254 mm) armor cable over 12” (305 mm) leads. Specify if other lead and/or cable lengths are required.

**TYPE W1 — Stainless Steel Wire Braid**

Provides good protection to lead wires where flexibility is needed.

Standard 10” (254 mm) braid over 12” (305 mm) leads. Specify if other lead and/or cable lengths are required.
Tubular Heaters

Mounting Methods

Tubular Heater Standard Mounting Methods

TYPE B — Bulkhead Fittings

Bulkhead fittings provide a leakproof method for mounting tubular heating elements through tank walls. Standard are round brass fittings crimped onto the element that are suitable for low pressure water (up to 80 psig) and non-pressure air. A brass hex nut, plated steel washer and gasket are supplied as standard. Fittings for vacuum or high pressure gas and liquid use are silver brazed or TIG welded. Method will vary by material and application. Fittings in table are most commonly used. Special fittings can be made to meet your application requirements.

TYPE MC — Mounting Collar

Plated steel mounting collars are locked in place with a set-screw and serve as an adjustable stop for through-the-wall mounting. Collars are shipped in bulk unless otherwise specified. Mounting collars can be ordered with the heater or purchased separately.

TYPE LR — Locator Washer

Locator washers are permanently attached to the heater sheath by staking/crimping and are used to limit the movement of the heater while allowing for expansion and contraction of the heater sheath. When ordering, specify location from end of sheath.

TYPE MF — Mounting Bracket

Tempco’s made-to-order mounting brackets are made from 18 gauge stainless steel for strength and stiffness. It is an economical way to mount the heater in non-pressurizing, non-liquid applications. Unless otherwise specified, the bracket will be located 1/2" from the edge of the heater sheath. OEM quantity brackets are manufactured by Tempco on our own high speed precision N/C Turret Press. The standard method of attaching the tubular element to the bracket is staking or crimping. The rectangular mounting bracket shown at right is a popular made-to-order design. Specify all dimensions shown when requesting a quote. Custom brackets of any size, thickness or material can be supplied to meet your requirements.
Magnesium Oxide (MgO) is used as the insulating material in Tempco tubular heaters because of its excellent thermal conductivity and dielectric strength. However, MgO is hygroscopic and can absorb moisture from the atmosphere. This absorption of moisture may be detected when an Insulation Resistance (IR) test is done with a megohmmeter prior to energizing the heater circuit. In very humid environments, circuits utilizing a GFI (ground fault interrupter) for safety may experience nuisance tripping when energizing the heater.

The Tempco manufacturing process produces a dry element with an IR of several thousand megohms minimum. However, after shipment and depending on humidity levels and storage time, a heater can absorb moisture and show a decrease in IR. In many cases, depending on the supply voltage and the application, the heater can be safely energized and will dry itself out.

Style SS—Silicone Resin Seal
A brushed-on coating that penetrates the MgO, offering economical moisture protection under humid storage conditions.

Maximum Usable Termination Temperature: 390°F (200°C)
UL Rated Maximum Termination Temperature: 221°F (105°C)
Type V2A: conformal coating
Type V2B: silicone oil

Style SER—RTV Seal
RTV (room temperature vulcanizing) silicone rubber adhesive sealant provides a good moisture seal.

UL Rated – Maximum Termination Temperature:
Type R: 302°F (150°C)
Type R1: 392°F (200°C)

If a heater has absorbed moisture, a safe and effective method of drying it out prior to installation is to bake it in an oven at 300°F (149°C) until an acceptable IR reading is obtained. When possible, removing the terminal hardware will expedite this process. If this method is not practical consult factory for other recommendations.

For applications where moisture absorption would be unacceptable Tempco has several optional element end seals to retard absorption of moisture in the MgO. If a true hermetic seal is required, ceramic to metal end seals (Type H) are available. With any of these seals, the maximum recommended termination temperature in the seal area must not be exceeded.

Style SEH—Epoxy Resin Seal
Epoxy resin provides a moisture resisting barrier.

UL Rated – Maximum Termination Temperature:
Type V: 194°F (90°C)
Type V1: 266°F (130°C)
Type V4: 392°F (200°C)
For more information, contact Tempco at (800) 323-6859 or Email: sales@tempco.com.

Tubular Heater Standard Bend Formations

Forming Tubular Elements

The MgO insulation used in tubular heating elements is compacted by reducing the element diameter in a roll reducing mill. The elements are then annealed in a controlled atmosphere furnace to relieve the metal stressing (work hardening) that takes place during the rolling to size reduction of the sheath. Annealing brings the metal back to a soft state, allowing the element to be bent into virtually any configuration. However, since forming also work hardens the metal, some precautions must be observed in order to prevent the sheath from breaking during bending or developing stress cracking marks.

**Note:** Elements with tight bends and some applications require the bends to be recompacted in special dies to restore the integrity of the insulation density and maintain dielectric strength. Large bends do not need to be recompacted.

Avoid bends within a minimum of 1/2" of the terminal pin and resistance wire junctions unless the bending radius is a minimum 3*(75 mm).

The table below provides the minimum bending radii for different element diameters:

<table>
<thead>
<tr>
<th>Element Diameter (in mm)</th>
<th>Factory Bend Minimum R (in mm)</th>
<th>Field Bend Minimum R (in mm)</th>
<th>Minimum S (in mm)</th>
</tr>
</thead>
<tbody>

Heat Transfer Cement

When tubular heating elements are used in a milled slot any air gaps between the element and the plate can cause hot spots on the element. Heat transfer cement is used to fill these air gaps, permitting the heater to run cooler, thus maximizing its life expectancy. Cement is water soluble and can be applied with a putty knife or trowel and can be used in temperatures up to 1250°F (675°C).

Tubular Heaters for Hot Runner Manifolds

Construction
Hot Runner Manifold Heaters are made to order using .260", .315" or .375" diameter Incoloy® tubular heating elements. Commonly specified terminations include threaded stud or wire leads.

Important Information on Forming
Precise forming of the tubular heater is required for it to seat properly into the milled slot in the manifold. To ensure this fit, we use a physical template as an inspection tool in the forming process to verify bending accuracy.

The template is a reproduction of the milled slot in the form of a plastic or aluminum plate. It can be customer supplied or manufactured by Tempco. Only through the use of a forming template is bending accuracy guaranteed.

When ordering for new applications:
Supply a drawing or forming template if available.

When ordering for replacement:
Supply a sample heater and/or a drawing of the manifold indicating the milled heater slot.

Note: For heaters originally manufactured by Tempco only the Tempco Part Number is required.
Standard tubular heaters are fully annealed for field or factory bending. They are inventoried with plain pin extensions that allow quick installation of Termination Types T, TM, F1, A, E, SF, SF9, L and L9. Part Numbers listed are for heaters with Type “T” termination. For other terminations a Part Number will be issued at time of order.

**Catalog Heaters**

Part Numbers in RED are in stock for immediate delivery with Type T termination.

Termination Types TM, F1, A, E, SF, SF9, L, and L9 can be applied to stock heaters. For these terminations the Heater Part Number will be issued at time of order. Non-Stock Part Numbers are standard designs that are available straight in 2 weeks and formed in 4 weeks.

**Custom Engineered/Manufactured Heaters**

An electric heater can be very application specific; for sizes and ratings not listed, TEMPCO will design and manufacture a tubular heater to meet your requirements. **Standard lead time is 4 weeks.**

Please Specify the following:

- Type of Application
- Wattage and Voltage
- Diameter
- Heated Length
- Unheated Length at Each End
- Sheath Material
- Termination Type
- Type of Mounting, if Required
- Type of Moisture Seal, if Required
- Bending Configuration (supply Drawing and/or Sample)
