Warning Symbol

This symbol calls attention to an operating procedure, practice, or the like which, if not correctly performed or adhered to, could result in personal injury or damage to or destruction of part or all of the product and system. Do not proceed beyond a warning symbol until the indicated conditions are fully understood and met. Information in this user’s manual is subject to change without notice.

NOTE:

It is strongly recommended that a process should incorporate a LIMIT CONTROL such as the TEC-910 which will shut down the equipment at a preset process condition in order to preclude possible damage to products or system.

1–1 Features

** High accuracy 18-bit input A–D
** High accuracy 15-bit output D–A
** Fast input sample rate (5 times/second)
** Two function complexity levels
** User menu configurable
** Pump control
  * Fuzzy plus PID microprocessor-based control
  * Automatic programming
  * Differential control
  * Auto-tune function
  * Self-tune function

* Sleep mode function
* “Soft-start” ramp and dwell timer
* Programmable inputs(thermocouple, RTD, mA, VDC)
* Analog input for remote set point and CT
* Event input for changing function and set point
* Programmable digital filter
* Hardware lockout and remote lockout protection
* Loop break alarm

** Unique
* Heater break alarm
* Sensor break alarm and bumpless transfer
* RS-485, RS-232 communication
* Analog retransmission
* Signal conditioner DC power supply
* A wide variety of output modules available
* Safety UL/IEC 1010–1
* EMC/CE EN 61326

The TEC-4300 Fuzzy Logic plus PID microprocessor-based controller incorporates a bright, easy to read, 4-digit LED display which indicates the process value. Fuzzy Logic technology enables a process to reach a predetermined set point in the shortest time, with the minimum of overshoot during power-up or external load disturbance. The units are housed in a 1/4 DIN case, measuring 96mm x 96mm with 53mm behind-panel depth. The units feature three touch keys to select the various control and input parameters. Using a unique function, you can put up to five parameters at the front of the user menu by using SEL1 to SEL5 found in the setup menu. This is particularly useful to OEM’s as it is easy to configure the menu to suit the specific application.

TEC-4300 is powered by 11–26V AC/VDC or 90–264V AC supply, incorporating dual 2 amp. control relays output and dual 2 amp. alarm relays output as standard. Alternative output options include SSR drive, triac, 4–20mA and 0–10 volts. TEC-4300 is fully programmable for PT100, thermocouple types J, K, T, E, B, R, S, N, L, 0–20mA, 4–20mA, and voltage signal input, with no need to modify the unit. The input signals are digitized by using an 18-bit A to D converter. Its fast sampling rate allows the TEC-4300 to control fast processes such as pressure and flow. Self-tuning is incorporated. Self-tuning can be used to optimize the control parameters as soon as undesired control results are observed. Unlike auto-tuning, self-tuning will produce less disturbance to the process during tuning, and can be used at any time.

Digital communications formats RS-485, RS-232 or 4–20mA retransmission are available as an additional option. These options allow the TEC-4300 to be integrated with supervisory control systems and software, or alternatively to drive remote displays, chart recorders, or data loggers.

Two different methods can be used to program the TEC-4300. 1. Use the keys on the front panel to program the unit manually; 2. use a PC with setup software to program the unit via the RS-485 or RS-232 COMM port.

For nearly a hundred years, PID control has been used and has proven to be an efficient controlling method by many industries, yet PID has difficulty dealing with some sophisticated systems such as second and higher order systems, long time-lag systems, during set point change and/or load disturbance circumstances, etc. The PID principle is based on a mathematical model which is obtained by tuning the process. Unfortunately, many systems are too complex to describe precisely in numerical terms. In addition, these systems may be variable from time to time. In order to overcome the imperfections of PID control, Fuzzy Technology was introduced. What is Fuzzy Control? It works like a good driver. Under different speeds and circumstances, he can control a car well based on previous experience, and does not require knowledge of the kinetic theory of motion. Fuzzy Logic is a linguistic control which is different from the numerical PID control. It controls the system by experience and does not need to simulate the system precisely as a PID controller would.

The function of Fuzzy Logic is to adjust PID parameters internally in order to make manipulation of output value MV more flexible and adaptive to various processes. The Fuzzy Rule may work like this:
If the temperature difference is large, and the temperature rate is large, then DMV is large.
If the temperature difference is large, and the temperature rate is small, then DMV is small.

PID+Fuzzy Control has been proven to be an efficient method to improve the control stability as shown by the comparison curves below:
## 1-2 Ordering Code

**TEC-4300-**

### Power Input
- 1: Standard Input
- 2: Universal Input
- 4: 0-240 VAC, 50/60 Hz
- 5: 11-26 VAC or VDC
- 9: Special Order

### Signal Input
1: Standard Input
Input 1 - Universal Input
Thermocouple: J, K, T, E, B, R, S, N, L - Type “J”
RTD: PT100 DIN, PT100 JIS
Current: 4-20 mA, 0-20 mA.
Voltage: 0-1 V, 0-5 V, 1-5 V, 0-10 V

Input 2 - CT and Analog Input
- CT: 0-50 Amp AC Current Transformer
- Analog Input: 4-20 mA, 0-20 mA, 0-1 V, 0-5 V, 1-5 V, 0-10 V

Input 3 - Event Input (EI)
- 9: Special Order

### Alarm 1
- 0: None
- 1: Form C Relay 1A / 240VAC
- 2: Pulsed voltage to drive SSR, 5V/30mA
- 3: Isolated 4-20 mA / 0-20 mA
- 4: Isolated 1-5 V / 0-5 V
- 5: Isolated 0-10 V
- 6: Triac Output 1A / 240VAC SSR
- 9: Special Order

### Alarm 2
- 0: None
- 1: Relay 2A / 240VAC
- 2: Pulsed voltage to drive SSR, 5V / 30mA
- 3: Isolated 4-20 mA / 0-20 mA
- 4: Isolated 1-5 V / 0-5 V
- 5: Isolated 0-10 V
- 6: Triac Output 1A / 240VAC SSR
- 9: Special Order

### Communications
- 0: None
- 1: RS-485
- 2: RS-232
- 3: Retransmit 4-20 mA / 0-20 mA
- 4: Retransmit 1-5 V / 0-5 V
- 5: Retransmit 0-10 V
- 9: Special Order

### Output 1
- 1: Relay 2A / 240VAC
- 2: Pulsed voltage to drive SSR, 5V / 30mA
- 3: Isolated 4-20 mA / 0-20 mA
- 4: Isolated 1-5 V / 0-5 V
- 5: Isolated 0-10 V
- 6: Triac Output 1A / 240VAC SSR
- 9: Special Order

### Output 2
- 0: None
- 1: Relay 2A / 240VAC
- 2: Pulsed voltage to drive SSR, 5V / 30mA
- 3: Isolated 4-20 mA / 0-20 mA
- 4: Isolated 1-5 V / 0-5 V
- 5: Isolated 0-10 V
- 6: Triac Output 1A / 240VAC SSR
- 7: Isolated 20V / 25mA DC Output Power Supply
- 8: Isolated 12V / 40 mA DC Output Power Supply
- 9: Isolated 5V / 80mA DC Output Power Supply
- A: Special order
- * Range set by front keyboard
- ** Need to order accessory TEC99999 if Heater Break detection is required.

### Accessories
- **TEC99999** — 0-50 amp AC current transformer
- **TEC101-101** — Isolated 4-20mA/0-20mA analog output module
- **TEC101-114** — Isolated 1-5V/0-5V analog output module
- **TEC101-115** — Isolated 0-10V analog output module
- **TEC101-109** — Isolated 1A/240VAC triac output module ( SSR )
- **TEC101-111** — Isolated 20V/25mA DC output power supply
- **TEC101-112** — Isolated 12V/40mA DC output power supply
- **TEC101-113** — Isolated 5V/80mA DC output power supply
- **TEC102-101** — Isolated RS-485 interface module
- **TEC102-103** — Isolated RS-232 interface module
- **TEC102-104** — Isolated 4-20mA/0-20mA retransmission module
- **TEC102-105** — Isolated 1-5V/0-5V retransmission module
- **TEC102-106** — Isolated 0-10V retransmission module
- **TEC99014** — RS-232 interface cable (2M)
- **TEC99927** — Modbus to USB converter

---

### Related Products
- **TEC99001** — Smart network adapter for third party software; converts 255 channels of RS-485 or RS-422 to RS-232 network
- **TEC99002** — Smart network adapter for DAQ software; converts 255 channels of RS-485 or RS-422 to RS-232 network
- **TEC99923** — DAQ software for data acquisition and control
The programming port is used for off-line automatic setup and testing procedures only. Do not attempt to make any connection to these pins when the unit is being used for normal control purposes. When the unit leaves the factory, the DIP switch is set so that TC and RTD are selected for input 1 and all parameters are unlocked unless a different configuration is specified. Lockout function is used to disable the adjustment of parameters as well as operation of calibration mode. However, the menu can still be viewed even under lockout condition.

*SEL1-SEL5 represent those parameters which are selected by using SEL1, SEL2,...SEL5 parameters contained in the setup menu. The parameters that have been selected are then allocated at the beginning of the user menu.
1-4 Keys and Displays

The unit is programmed by using the three keys on the front panel. The available key functions are listed in the following table.

Table 1.2 Keypad Operation

<table>
<thead>
<tr>
<th>TOUCHKEYS</th>
<th>FUNCTION</th>
<th>DESCRIPTION</th>

<td>Reverse Scroll Key</td>
<td>Scrolls through the parameters in reverse order during menu scrolling.</td>
</tr>
<tr>
<td>Press</td>
<td>Mode Key</td>
<td>Selects the operation mode in sequence.</td>
</tr>
<tr>
<td>Press</td>
<td>Reset Key</td>
<td>Resets the front panel display to normal display mode, also used to leave the specific mode execution, to end auto-tune and manual control execution, and to quit sleep mode.</td>
</tr>
<tr>
<td>Press</td>
<td>Sleep Key</td>
<td>The controller enters sleep mode if the sleep function (SLEEP) is enabled (select YES).</td>
</tr>
</tbody>
</table>

How to display a 5-digit number

For a number with decimal point the display will be shifted one digit right:
- 199.99 will be displayed by -199.9
- 4553.6 will be displayed by 4553

For a number without decimal point the display will be divided into two alternating phases:
- -9999 will be displayed by:

4

9999

45536 will be displayed by:

9999

-
Figure 1.5 Display Sequence of Initial Message

All segments of display and indicators are left off for 0.5 second.

All segments of display and indicators are lit for 2 seconds.

Display program code of the product for 2.5 seconds.

The left diagram shows program no. 4 (for TEC-4300) with version 39.

Display Date Code and Serial number for 2.5 seconds.

The left diagram shows Year 2001, Month May (5), Date 22nd and Serial number 192. This means that the product is the 192nd unit produced on May 22nd, 2001.

Note that the month code A stands for October, B stands for November and C stands for December.

Display the used hours for 2.5 seconds.

The left diagram shows that the unit has been used for 23456.2 hours since production.
Apply these modes will break the control loop and change some of the previous setting data. Make sure that if the system is allowable to use these modes.

1: The flow chart shows a complete listing of all parameters. For actual application the number of available parameters depends on setup conditions, and should be less than that shown in the flow chart. See Appendix A-1 for the existence conditions of each parameter.

2: You can select at most 5 parameters put in front of the user menu by using SEL1 to SEL5 contained at the bottom of setup menu.

**Home Screen**

The menu will revert to PV/SV display after keyboard is kept untouched for 2 minutes except Display Mode Menu and Manual Mode Menu. However, the menu can revert to PV / SV display at any time by pressing and .
The controller performs closed loop control in its normal control mode condition. The controller will maintain its normal control mode when you are operating the user menu, setup menu, or display mode, reloading default values, or applying event input signals. Under certain conditions, the normal control mode will transfer to an exception mode. The exception modes include: sleep mode, manual mode, failure mode, calibration mode, and auto-tuning mode. All of these modes perform in an open loop control except auto-tuning mode which performs ON-OFF plus PID closed loop control. The mode transfer is governed by the priority conditions. A lower priority mode can not alter a higher priority mode, as shown in figure 1.6.

Calibration mode, auto-tuning mode, and normal control mode are in the same priority level. Sleep mode is in the highest priority level.

If PVMD = PV1
Range of SP2 same as range of
IN1, IN2, IN1, IN2

#### Exception:
If any of A1SP, A2SP or SP2 is configured with respect to CT input, its adjustment range is unlimited.
Chapter 2 Installation

Dangerous voltage capable of causing death can be present in this instrument. Before installation or beginning any troubleshooting procedures, the power to all equipment must be switched off and isolated. Units suspected of being faulty must be disconnected and removed to a properly equipped workshop for testing and repair. Component replacement and internal adjustments must be made by a qualified maintenance person only.

To minimize the possibility of fire or shock hazards, do not expose this instrument to rain or excessive moisture.

Do not use this instrument in areas under hazardous conditions such as excessive shock, vibration, dirt, moisture, corrosive gases, or oil. The ambient temperature of the areas should not exceed the maximum rating specified in chapter 8.

2–1 Unpacking

Upon receipt of the shipment, remove the unit from the carton and inspect the unit for shipping damage.

If there is any damage due to transit, report the damage and file a claim with the carrier. Write down the model number, serial number, and date code for future reference when corresponding with our service center. The serial number (S/N) and date code (D/C) are labeled on the box and the housing of the controller.

2–2 Mounting

Make the panel cutout to fit the dimensions shown in figure 2.1. Remove both mounting clamps and insert the controller into the panel cutout. Reinstall the mounting clamps. Gently tighten the screws in the clamp until the controller front panel fits snugly in the cutout.

2–3 Wiring Precautions

• Before wiring, verify the correct model number and options on the label. Switch off the power while checking.

• Care must be taken to ensure that the maximum voltage rating specified on the label is not exceeded.

• It is recommended that the power for these units be protected by fuses or circuit breakers rated at the minimum value possible.

• All units should be installed in a suitable enclosure to prevent live parts from being accessible to human hands and metal tools. Metal enclosures and/or subpanels should be grounded in accordance with national and local codes.

• All wiring must conform to appropriate standards of good practice and local codes and regulations. Wiring must be suitable for the voltage, current, and temperature rating of the system.

• Beware not to over-tighten the terminal screws. The torque should not exceed 1 N-m (8.9 lb-in or 10 KgF-cm).

• Unused control terminals should not be used as jumper points as they may be internally connected, causing damage to the unit.

• Verify that the ratings of the output devices and the inputs as specified are not exceeded.

• Except for thermocouple wiring, all wiring should use stranded copper conductor with a maximum gage of 14 AWG.

• Electrical power in industrial environments contains a certain amount of noise in the form of transient voltage and spikes. This electrical noise can adversely affect the operation of microprocessor-based controls. For this reason the use of shielded thermocouple extension wire which connects the sensor to the controller is strongly recommended. This wire is a twisted-pair construction with foil wrap and drain wire. The drain wire is to be attached to ground in the control panel only.
2–4 Power Wiring

The controller is supplied to operate at 11–26V AC/VDC or 90–264V AC. Check that the installation voltage corresponds to the power rating indicated on the product label before connecting power to the controller.

⚠️ This equipment is designed for installation in an enclosure which provides adequate protection against electrical shock. The enclosure must be connected to earth ground.

Local requirements regarding electrical installation should be rigidly observed. Consideration should be given to prevent unauthorized personnel from gaining access to the power terminals.

2–5 Sensor Installation Guidelines

Proper sensor installation can eliminate many problems in a control system. The probe should be placed so that it can detect any temperature change with minimal thermal lag. In a process that requires fairly constant heat output, the probe should be placed close to the heater. In a process where the heat demand is variable, the probe should be close to the work area. Some experiments with probe location are often required to find the optimum position.

In a liquid process, the addition of a stirrer will help eliminate thermal lag. Since a thermocouple is basically a point measuring device, placing more than one thermocouple in parallel can provide an average temperature readout and produce better results in most air-heated processes.

The proper sensor type is also a very important factor in obtaining precise measurements. The sensor must have the correct temperature range to meet the process requirements. In special processes, the sensor might have additional requirements such as leak-proof, anti-vibration, antiseptic, etc.

Standard sensor limits of error are ±4°F (±2°C) or 0.75% of sensed temperature (half that for special) plus drift caused by improper protection or an over-temperature occurrence. This error is far greater than controller error and cannot be corrected on the sensor except by proper selection and replacement.

2–6 Thermocouple Input Wiring

The thermocouple input connections are shown in figure 2.5. The correct type of thermocouple extension lead-wire or compensating cable must be used for the entire distance between the controller and the thermocouple, ensuring that the correct polarity is maintained throughout. Joints in the cable should be avoided, if possible.

If the length of the thermocouple plus the extension wire is too long, it may affect the temperature measurement. A 400 ohms K type or a 500 ohms J type thermocouple lead resistance will produce approximately 1°C temperature error.

* Color of overall sheath
2–7 RTD Input Wiring

The RTD connections are shown in figure 2.6, with the compensating lead connected to terminal 19. For two-wire RTD inputs, terminals 19 and 20 should be linked. A three-wire RTD offers the capability of lead resistance compensation, provided that the three leads are the same gauge and equal in length.

For the purpose of accuracy, a two-wire RTD should be avoided if possible. A 0.4ohm lead resistance in a two-wire RTD will produce 1°C temperature error.

2–8 Linear DC Input Wiring

DC linear voltage and linear current connections for input 1 are shown in figure 2.7 and figure 2.8.
DC linear voltage and linear current connections for input 2 are shown in figure 2.9 and figure 2.10.
Make sure that the total current through TEC99999 does not exceed 100A rms in a 3-Phase system.
The event input can accept a switch signal as well as an open collector signal. The event input function (EIFN) is activated when the switch is closed or an open collector (or a logic signal) is pulled down.

Also refer to section 4-1 for event input functions.

Terminator
220 ohms / 0.5W
If you use a conventional 9-pin RS-232 cable instead of TEC99014, the cable must be modified according to the following circuit diagram.
2–17 Analog Retransmission

Retransmit Current

The total effective resistance of serial loads can't exceed 500 ohms.

Figure 2.22 Analog Retransmission Wiring

Retransmit Voltage

The total effective resistance of parallel loads should be greater than 10K Ohms.
2-18 Programming Port

See figure 1.3 in section 1-3 to find the programming port location.

See Figure 1.3 in Section 1-3 to find the programming port location.

NOTE:
The programming port is used for off-line automatic setup and testing procedures only. Do not attempt to make any connection to these jumpers when the unit is used for a normal control purpose.
This unit provides a useful parameter “FUNC” which can be used to select the function complexity level before setup. If Basic Mode (FUNC=BASC) is selected for a simple application, then the following functions are ignored and deleted from the full function menu: RAMP, SP2, PB2, TI2, TD2, PL1, PL2, COMM, PROT, ADDR, BAUD, DATA, PARI, STOP, AOIFN, ALOO, AOHI, IN2, IN2U, DP2, IN2L, IN2H, EIFN, PVMD, FILT, SLEP, SPMD, and SP2F.

### Basic Mode capabilities:

1. **Input 1:**
   - thermocouple, RTD, volt, mA
   - sensor break, latch, hold, or normal alarm.
   - Range: (Thermocouple) J,TC; K,TC; T,TC; E_TC; B,TC; R, TC; S,TC; N,TC; L,TC
     (RTD) PT.DN, PT.JS
     (Linear) 4–20, 0–20, 0–1V, 0–5V, 1–5V, 0–10
   - Default: J,TC if °F is selected, K,TC if °C is selected.

2. **Input 2:**
   - CT for heater break detection
   - Range: °C, °F, PU (process unit). If the unit is neither °C nor °F, then PU is selected.
   - Default: °C or °F

3. **Output 1:** heating or cooling (relay, SSR, SSRD, volt, mA)
   - sensor break, latch, hold, or normal alarm.
   - 7. Dwell timer
   - 8. Heater break alarm
   - 9. Loop break alarm
   - 10. Sensor break alarm
   - 11. Failure transfer
   - 12. Bumpless transfer
   - 13. PV1 shift
   - 14. Programmable SP1 range
   - 15. Heat-cool control
   - 16. Hardware lockout
   - 17. Self-tune
   - 18. Auto-tune
   - 19. ON-OFF, P, PD, PI, PID control
   - 20. User-defined menu (SEL)
   - 21. Manual control
   - 22. Display mode
   - 23. Reload default values
   - 24. Isolated DC Power supply

4. **Output 2:**
   - cooling (relay, SSR, SSRD, volt, mA), DC power supply

5. **Alarm 1:**
   - relay for deviation, deviation band, process, heater break, loop break, sensor break, latch, hold, or normal alarm.
   - 6. **Alarm 2:**
     - relay for deviation, deviation band, process, heater break, loop break, sensor break, latch, hold, or normal alarm.

6. **If you don’t need:**
   - 1. Second setpoint
   - 2. Second PID
   - 3. Event input
   - 4. Soft start (RAMP)
   - 5. Remote set point
   - 6. Complex process value
   - 7. Output power limit
   - 8. Digital communication
   - 9. Analog retransmission
   - 10. Power shut off (sleep mode)
   - 11. Digital filter
   - 12. Pump control
   - 13. Remote lockout

### 3–1 Input 1

Press \[ \text{[up]} \text{[down]} \] to enter setup mode. Press \[ \text{[enter]} \] to select the desired parameter. The upper display indicates the parameter symbol, and the lower display indicates the selection or the value of the parameter.

**IN1:** Selects the sensor type and signal type for Input 1.

- **Range:**
  - (Thermocouple) J,TC; K,TC; T,TC; E_TC; B,TC; R, TC; S,TC; N,TC; L,TC
  - (RTD) PT.DN, PT.JS
  - (Linear) 4–20, 0–20, 0–1V, 0–5V, 1–5V, 0–10
  - **Default:** J,TC if °F is selected, K,TC if °C is selected.

**IN1U:** Selects the process unit for Input 1.

- **Range:** °C, °F, PU (process unit). If the unit is neither °C nor °F, then PU is selected.
- **Default:** °C or °F

**DP1:** Selects the location of the decimal point for most (not all) process-related parameters.

- **Range:** (T/C and RTD) NO.DP, 1-DP
  - (Linear) NO.DP, 1-DP, 2-DP, 3-DP
  - **Default:** 1-DP

**IN1L:** Selects the low scale value for Linear type input 1.

- **Hidden if:** T/C or RTD type is selected for IN1.

**IN1H:** Selects the high scale value for Linear type input 1

- **Hidden if:** T/C or RTD type is selected for IN1.

### How to use IN1L and IN1H:

If 4–20mA is selected for IN1, SL specifies the input signal low (i.e., 4mA), SH specifies the input signal high (i.e., 20mA), S specifies the current input signal value, and the conversion curve of the process value is shown as follows:

Example: If a 4–20mA current loop pressure transducer with range 0–15 kg/cm² is connected to input 1, then perform the following setup:

\[
\text{IN1}=4–20 \quad \text{IN1L}=0.0 \quad \text{IN1U}=15.0 \quad \text{DP1}=1-DP
\]

*Of course, you may select another value for DP1 to alter the resolution.*

![Figure 3.1 Conversion Curve for Linear Type Process Value](image-url)

Formula: \[ \text{PV1} = \text{IN1L} + \left( \frac{\text{IN1H} - \text{IN1L}}{\text{SH} - \text{SL}} \right) \cdot (\text{S} - \text{SL}) \]
3–2 OUT1 and OUT2 Types

**O1TY**: Selects the signal type for Output 1.
- The selection should be consistent with the output 1 module installed.
- The available output 1 signal types are:
  - RELY: Mechanical relay
  - SSRD: Pulsed voltage output to drive SSR
  - SSR: Isolated zero-switching solid-state relay
  - 4–20: 4–20mA linear current output
  - 0–20: 0–20mA linear current output
  - 0–1V: 0–1V linear voltage output
  - 0–5V: 0–5V linear voltage output
  - 1–5V: 1–5V linear voltage output
  - 0–10V: 0–10V linear voltage output

**O2TY**: Selects the signal type for Output 2
- The selection should be consistent with the output 2 module installed.
- The available output 2 signal types are the same as for O1TY.

The range for linear current or voltage may not be very accurate. For 0% output, the value for 4–20mA may be 3.8–4mA; while for 100% output, the value for 4–20mA may be 20–21mA. However, this deviation will not degrade the control performance at all.

3–3 Configuring User Menu

Most conventional controllers are designed with a fixed order in which the parameters scroll. The TEC-4300 has the flexibility to allow you to select those parameters which are most significant to you and put these parameters at the front of the display sequence.

**SEL1**: Selects the most significant parameter for view and change.

**SEL2**: Selects the 2nd most significant parameter for view and change.

**SEL3**: Selects the 3rd most significant parameter for view and change.

**SEL4**: Selects the 4th most significant parameter for view and change.

**SEL5**: Selects the 5th most significant parameter for view and change.

**Range**: NONE, TIME, A1.SP, A1.DV, A2.SP, A2.DV, RAMP, OFST, REFC, SHIF, PB1, TI1, TD1, C.PB, DB, SP2, PB2, TI2, TD2

When using the up and down keys to select the parameters, you may not see all of the above parameters. The number of visible parameters is dependent on the setup condition. The hidden parameters for the specific application are also deleted from the SEL selection.

Example:

- A1FN selects TIMR
- A2FN selects DE.HI
- PB1=10
- TI1=0
- SEL1 selects TIME
- SEL2 selects A2.DV
- SEL3 selects OFST
- SEL4 selects PB1
- SEL5 selects NONE

Now, the upper display scrolling becomes:

```
PV     ->  t, nE  ->  A2.dV  ->  OFST  ->  PB1  
```
3–4 Heat Only Control

Heat Only ON-OFF Control: Select REVR for OUT1, set PB1 to 0, SP1 is used to adjust set point value, O1HY is used to adjust dead band for ON-OFF control. Output 1 hysteresis (O1HY) is enabled in the case of PB1=0. The heat only on-off control function is shown in the following diagram:

The ON-OFF control may introduce excessive process oscillation even if hysteresis is minimized to the smallest. If ON-OFF control is set (i.e., PB1=0), TI1, TD1, CYC1, OFST, CPB and PL1 will be hidden and have no function. The manual mode, auto-tuning, self-tuning and bumpless transfer will be disabled too.

Heat only P (or PD) control: Select REVR for OUT1, set TI1 to 0, SP1 is used to adjust set point value, TIME is used to adjust the dwell timer (enabled by selecting TIMR for A1FN or A2FN). OFST been enabled in case of TI1=0 is used to adjust the control offset (manual reset). Adjust CYC1 according to the output 1 type (O1TY).

Generally, CYC1=0.5~2 seconds for SSRD and SSR, CYC1=10~20 seconds for relay output. CYC1 is ignored if linear output is selected for O1TY. O1HY is hidden if PB1 is not equal to 0.

OFST Function: OFST is measured by % with range 0–100.0%. In the steady state (i.e., process has been stabilized), if the process value is lower than the set point a definite value, say 5°C, while 20°C is used for PB1, that is lower 25%, then increase OFST 25%, and vice versa.

After adjusting OFST value, the process value will be varied and eventually coincide with set point. Using the P control (TI1 set to 0), the auto-tuning and self-tuning are disabled. Refer to section 3-21 “manual tuning” for the adjustment of PB1 and TD1. Manual reset (adjust OFST) is not practical because the load may change from time to time and often need to adjust OFST repeatedly. The PID control can avoid this situation.

Heat only PID control: Selecting REVR for OUT1, SP1 is used to adjust set point value. TIME is used to adjust the dwell timer (enabled by selecting TIMR for A1FN or A2FN). PB1 and TI1 should not be zero. Adjust CYC1 according to the output 1 type (O1TY).

Generally, CYC1=0.5~2 seconds for SSRD and SSR, CYC1=10~20 seconds for relay output. CYC1 is ignored if linear output is selected for O1TY. In most cases, self-tuning can be used to substitute for auto-tuning. See section 3-19. If self-tuning is not used (select NONE for SELT), then use auto-tuning for the new process, or set PB1, TI1, and TD1 with historical values. See section 3-20 for auto-tuning operation. If the control result is still unsatisfactory, then use manual tuning to improve control. See section 3-21 for manual tuning. TEC-4300 contains a very clever PID and Fuzzy algorithm to achieve a very small overshoot and very quick response to the process if it is properly tuned.

3–5 Cool Only Control

ON-OFF control, P (PD) control, and PID control can be used for cool control. Set OUT1 to DIRT (direct action). The other functions for cool only ON-OFF control, cool only P (PD) control and cool only PID control are the same as the descriptions in section 3-5 for heat only control except that the output variable (and action) for the cool control is inverse to the heat control, such as the following diagram shows:

Refer to section 3-4, in which similar descriptions for heat only control can be applied to cool only control.
3–6 Heat-Cool Control

The heat-cool control can use one of six combinations of control modes. Setup of parameters for each control mode are shown in the following table.

Table 3.1 Heat-Cool Control Setup

<table>
<thead>
<tr>
<th>Control Modes</th>

<td>O1TY, CYC1, O2TY, CYC2, A2SP, A2DV</td>
<td>OUT1</td>
<td>OUT2</td>
</tr>
</tbody>
</table>

× : Not Applicable  ☆ : Adjust to meet process requirements

**NOTE:** The ON-OFF control may result in excessive overshoot and undershoot problems in the process. The P (or PD) control will result in a deviation process value from the set point. It is recommended to use PID control for the heat-cool control to produce a stable and zero offset process value.

Other Setup Required : O1TY, CYC1, O2TY, CYC2, A2SP, A2DV

O1TY and O2TY are set in accordance with the types of OUT1 and OUT2 installed. CYC1 and CYC2 are selected according to the output 1 type (O1TY) and output 2 type (O2TY). Generally, select 0.5~2 seconds for CYC1 if SSRD or SSR is used for O1TY. Select 10~20 seconds if relay is used for O1TY, and CYC1 is ignored if linear output is used. Similar conditions are applied to CYC2 selection.

**Examples:**

**Heat PID+Cool ON-OFF:** Set OUT1=REVR, A1FN or A2FN=PV1.H, A1FN or A2MD=NORM, A1HY or A2HY=0.1, PB1≠0, TI1≠0, TD1≠0, and set appropriate values for O1TY and CYC1.

**Heat PID+Cool PID:** Set OUT1=REVR, OUT2=COOL, CPB=100, DB=-4.0, PB1≠0, TI1≠0, TD1≠0, and set appropriate values for O1TY, CYC1, O2TY, CYC2.

If this is a new process, then use the self-tuning program to optimize the PID values by selecting YES for SELF. See section 3-18 for a description of the self-tuning program. Alternately you can use the auto-tuning program for the new process or manually set the appropriate values for PB1, TI1, and TD1 according to the historical records. If the control behavior is still inadequate, then use manual tuning to improve the control. See section 3-20 for more information on manual tuning.

**CPB Programming:** The cooling proportional band is measured by % of PB with a range of 1~255. Initially set 100% for CPB and examine the cooling effect. If the cooling action should be enhanced, decrease CPB. If the cooling action is too strong, increase CPB. The value of CPB is related to PB, and its value remains unchanged throughout the self-tuning and auto-tuning procedures.

Adjustment of CPB is related to the cooling media used. If air is used as the cooling medium, set CPB at 100(%). If oil is used as the cooling medium, set CPB at 125(%). If water is used as the cooling medium, set CPB at 250(%). Adjust as necessary.

**DB Programming:** Adjustment of DB is dependent on the system requirements. If a higher positive value of DB (greater dead band) is used, unwanted cooling action can be avoided, but an excessive overshoot over the set point will occur. If a lower negative value of DB (greater overlap) is used, an excessive overshoot over the set point can be minimized, but an unwanted cooling action will occur. It is adjustable in the range -36.0% to 36.0% of PB1 (or PB2 if PB2 is selected). A negative DB value shows an overlap area over which both outputs are active. A positive DB value shows a dead band area over which neither output is active.
3–7 Dwell Timer

Alarm 1 or alarm 2 can be configured as dwell timer by selecting TIMR for A1FN or A2FN, but not both, otherwise Er07 will appear.

As the dwell timer is configured, the parameter TIME is used for dwell time adjustment. The dwell time is measured in minutes ranging from 0 to 6553.5 minutes. Once the process reaches the set point the dwell timer starts to count from zero until timed out. The timer relay will remain unchanged until time out. The dwell timer operation is shown as diagram at right.

If alarm 1 is configured as dwell timer, A1SP, A1DV, A1HY and A1MD are hidden. The case is the same for alarm 2.

Example:
Set A1FN = TIMR or A2FN = TIMR, but not both.
Adjust TIME in minutes
A1MD (if A1FN = TIMR) or A2MD (if A2FN = TIMR) is ignored in this case.

![Figure 3.4 Dwell Timer Function](image)
3–8 Process Alarms

A process alarm sets an absolute trigger level (or temperature). When the process (could be PV1, PV 2, or PV1-PV2) exceeds that absolute trigger level, an alarm occurs. A process alarm is independent from the set point. Adjust A1FN (Alarm 1 function) in the setup menu. One of eight functions can be selected for process alarm. These are: PV1.H, PV1.L, PV2.H, PV2.L, P1.2.H, P1.2.L, D1.2.H, D1.2.L.

Process Alarm 1

**Setup:** A1FN, A1MD

**Adjust:** A1SP, A1HY

**Trigger level = A1SP±fiA1HY**

Process Alarm 2

**Setup:** OUT2, A2FN, A2MD

**Adjust:** A2SP, A2HY

**Trigger level = A2SP±fiA2HY**

Reset Latching alarm

1. Power off
2. Apply event input in accordance with proper selection of EIFN

or P1.2.L is selected, the alarm occurs if the PV1 or PV2 value exceeds the trigger level. When D1.2.H or D1.2.L is selected, the alarm occurs if the PV1-PV2 (difference) value exceeds the trigger level. The trigger level is determined by A1SP (Alarm 1 set point) and A1HY (Alarm 1 hysteresis value) in User Menu for alarm 1. The hysteresis value is introduced to avoid interference action of alarm in a noisy environment. Normally A1HY can be set with a minimum (0.1) value. A1DV and/or A2DV are hidden if alarm 1 and/or alarm 2 are set for process alarm.

**Normal Alarm: A1MD = NORM**

When a normal alarm is selected, the alarm output is de-energized in the non-alarm condition and energized in an alarm condition.

**Latching Alarm: A1MD = LTCH**

If a latching alarm is selected, once the alarm output is energized, it will remain unchanged even if the alarm condition is cleared. The latching alarms are disabled when the power is shut off or if event input is applied with proper selection of EIFN.

**Holding Alarm: A1MD = HOLD**

A holding alarm prevents an alarm from powering up. The alarm is enabled only when the process reaches the set point value (may be SP1 or SP2, see section 4–1 event input). Afterwards, the alarm performs the same function as a normal alarm.

**Latching/Holding Alarm: A1MD = LT.HO**

A latching/holding alarm performs both holding and latching function.

---

**Examples:**

<table>
<thead>
<tr>
<th>A1SP = 200</th>
<th>A1HY = 10.0</th>
</tr>
</thead>
<tbody>
<tr>
<td>A1MD = NORM</td>
<td>A1FN = PV1.H</td>
</tr>
</tbody>
</table>

<tr>
<th>A1SP = 200</th>
<th>A1HY = 10.0</th>
<th>SP1 = 210</th>
</tr>
</thead>
<tbody>
<tr>
<td>A1MD = LT.HO</td>
<td>A1FN = PV1.L</td>
<td></td>
</tr>
</tbody>
</table>

![Figure 3.8 Latching/Holding Process Alarm](image)

Although the above descriptions are based on alarm 1, the same conditions can be applied to alarm 2.
3–9 Deviation Alarm

A deviation alarm alerts the user when the process deviates too far from the set point. The user can enter a positive or negative deviation value (A1DV, A2DV) for alarm 1 and alarm 2. A hysteresis value (A1HY or A2HY) can be selected to avoid interference problems in a noisy environment. Normally, A1HY and A2HY can be set with a minimum (0.1) value. The trigger level of the alarm moves with the set point.

For alarm 1, trigger level = SP1 + A1DV ± A1HY.
For alarm 2, trigger level = SP1 + A2DV ± A2HY.

A1SP and/or A2SP are hidden if alarm 1 and/or alarm 2 are set for deviation alarm.

One of four alarm modes can be selected for alarm 1 and alarm 2. These are: normal alarm, latching alarm, holding alarm and latching/holding alarm. See section 3-8 for descriptions of these alarm modes.

Examples:

2 Types of Deviation Alarms:
DE.HI, DE.LO

Deviation alarm 1:
Setup: A1FN, A1MD
Adjust: SP1, A1DV, A1HY
Trigger levels: SP1 + A1DV ± A1HY

Deviation alarm 2:
Setup: OUT2, A2FN, A2MD
Adjust: SP1, A2DV, A2HY
Trigger levels: SP1 + A2DV ± A2HY

![Figure 3.9 Normal Deviation Alarm](image)

![Figure 3.10 Latching Deviation Alarm](image)

![Figure 3.11 Holding Deviation Alarm](image)

![Figure 3.12 Latching/Holding Deviation Alarm](image)
3–10 Deviation Band Alarm

A deviation band alarm presets two reference levels relative to set point. Two types of deviation band alarm can be configured for alarm 1 and alarm 2. These are deviation band high alarm (A1FN or A2FN select DB.HI) and deviation band low alarm (A1FN or A2FN select DB.LO). A1SP and A1HY are hidden if alarm 1 is selected as a deviation band alarm. Similarly, A2SP and A2HY are hidden if alarm 2 is selected as a deviation band alarm. The trigger level for deviation band alarm moves with the set point. For alarm 1, the trigger level=SP1±A1DV. For alarm 2, the trigger level=SP1±A2DV. One of four alarm modes can be selected for alarm 1 and alarm 2. These are: normal alarm, latching alarm, holding alarm and latching/holding alarm. See section 3-8 for descriptions of these alarm modes.

Examples:

2 types of Deviation Band Alarms:
DB.HI, DB.LO

Deviation band alarm 1:
Setup: A1FN, A1MD
Adjust: SP1, A1DV
Trigger level = SP1±A1DV

Deviation band alarm 2:
Setup: OUT2, A2FN, A2MD
Adjust: SP1, A2DV
Trigger level = SP1±A2DV

Holding Deviation Band Alarm

Figure 3.16
Latching/Holding Deviation Band Alarm
3–11 Heater Break Alarm

A current transformer (Part Number TEC99999) should be installed to detect the heater current if a heater break alarm is required. The CT signal is sent to input 2, and the PV2 will indicate the heater current in 0.1amp resolution. The range of the current transformer is 0 to 50.0amp. For more detailed descriptions about heater current monitoring, please see section 3-24.

Examples:

A furnace uses two 2KW heaters connected in parallel to warm up the process. The line voltage is 220V and the rating current for each heater is 9.09A. If we want to detect any one heater break, set A1SP=13.0A, A1HY=0.1, A1FN=PV2.L, A1MD=NORM, then:

![Figure 3.17 Heater Break Alarm]

3–12 Loop Break Alarm

Select LB for A1FN if alarm 1 is required to act as a loop break alarm. Similarly, if alarm 2 is required to act as a loop break alarm, set OUT2 to AL2 and A1FN to LB. TIME, A1SP, A1DV, and A1HY are hidden if alarm 1 is configured as a loop break alarm. Similarly, TIME, A2SP, A2DV, and A2HY are hidden if alarm 2 is configured as a loop break alarm. One of four kinds of alarm modes can be selected for alarm 1 and alarm 2. These are: normal alarm, latching alarm, holding alarm and latching/holding alarm. The holding mode and latching/holding mode are not recommended for loop break alarm since the loop break alarm will not perform the holding function even if it is set for holding or latching/holding mode. See section 3-8 for descriptions of these alarm modes.

Loop break conditions are detected during a time interval of 2TI1 (double the integral time, but 120 seconds maximum). Hence the loop break alarm doesn’t respond as quickly as it occurs. If the process value doesn’t increase (or decrease) by the time the control variable MV1 has reached its maximum (or minimum) value within the detecting time interval, a loop break alarm (if configured) will be activated.

Loop break alarm (if configured) occurs when any of the following conditions happen:

1. Input sensor is disconnected (or broken).
2. Input sensor is shorted.
3. Input sensor is defective.
4. Input sensor is installed outside (isolated from) the process.
5. Controller fails (A-D converter damaged).
6. Heater (or chiller, valve, pump, motor etc.) breaks, fails, or is uninstalled.
7. Switching device (used to drive heater) is open or shorted.
3–13 Sensor Break Alarm
Alarm 1 or alarm 2 can be configured as a sensor break alarm by selecting SENB for A1FN or A2FN. The sensor break alarm is activated as soon as failure mode occurs. Refer to section 3–16 for failure mode conditions. Note that A-D failure also creates a sensor break alarm. TIME, A1SP, A1DV, and A1HY are hidden if alarm 1 is configured as a sensor break alarm. Similarly, TIME, A2SP, A2DV and A2HY are hidden if alarm 2 is configured as a sensor break alarm. One of four kinds of alarm modes can be selected for sensor break alarm. These are: normal alarm, latching alarm, holding alarm and latching/holding alarm. However, the holding alarm and latching/holding alarm are not recommended since the sensor break alarm will not perform the holding function even if it is set for holding or latching/holding mode. See section 3–8 for the descriptions of these alarm modes.

3–14 SP1 Range
SP1L (SP1 low limit value) and SP1H (SP1 high limit value) in the setup menu are used to confine the adjustment range of SP1.

Example:
A freezer is working in its normal temperature range -10°C to -15°C. In order to avoid an abnormal set point, SP1L and SP1H are set with the following values:
SP1L=-15°C    SP1H=-10°C
Now SP1 can only be adjusted within the range of -10°C to -15°C.

3–15 PV1 Shift
In certain applications it is desirable to shift the controller display value from its actual value. This can be easily accomplished by using the PV1 shift function.

Press the “scroll” key to bring up the parameter SHIF. The value you adjust here, either positive or negative, will be added to the actual value. The SHIF function will alter PV1 only.

Here is an example. A process is equipped with a heater, a sensor, and a subject to be warmed up. Due to the design and position of the components in the system, the sensor could not be placed any closer to the part. Thermal gradient (different temperature) is common and necessary to an extent in any thermal system for heat to be transferred from one point to another. If the difference between the sensor and the subject is 35°C, and the desired temperature at the subject to be heated is 200°C, the controlling value or the temperature at the sensor should be 235°C. You should input -35°C so as to subtract 35°C from the actual process display. This in turn will cause the controller to energize the load and bring the process display up to the set point value.
3–16 Failure Transfer

The controller will enter failure mode if one of the following conditions occurs:

1. **SB1E** occurs due to input 1 sensor break or input 1 current below 1mA if 4–20mA is selected or input 1 voltage below 0.25V if 1–5V is selected.
2. **SB2E** occurs due to input 2 sensor break or input 2 current below 1mA if 4–20mA is selected or input 2 voltage below 0.25V if 1–5V is selected.
3. **ADER** occurs if the A-D converter of the controller fails.

Output 1 and output 2 will perform the failure transfer function if one of the following conditions occurs:

1. During power starts (within 2.5 seconds).
2. The controller enters failure mode.
3. The controller enters manual mode.
4. The controller enters calibration mode.

**Output 1 failure transfer, if activated, will perform:**

1. If output 1 is configured as proportional control (PB1 ≠ 0), and **BPLS** is selected for O1FT, then output 1 will perform bumpless transfer. Thereafter, the previous averaging value of MV1 will be used for controlling output 1.
2. If output 1 is configured as proportional control (PB1 ≠ 0), and a value of 0 to 100.0% is set for O1FT, then output 1 will perform failure transfer. Thereafter, the value of O1FT will be used for controlling output 1.
3. If output 1 is configured as ON-OFF control (PB1 ≠ 0), then output 1 will be driven OFF if O1FN selects REV and be driven ON if O1FN selects DIRT.

**Output 2 failure transfer, if activated, will perform:**

1. If COOL is selected for OUT2, and **BPLS** is selected for O1FT, then output 2 will perform bumpless transfer. Thereafter, the previous averaging value of MV2 will be used for controlling output 2.
2. If COOL is selected for OUT2, and a value of 0 to 100.0% is set for O2FT, then output 2 will perform failure transfer. Thereafter, the value of O1FT will be used for controlling output 2.

**Alarm 1 failure transfer** is activated as the controller enters failure mode. Thereafter, alarm 1 will transfer to the ON or OFF state preset by A1FT.

**Exception:** If A1FN is configured for loop break (LB) alarm or sensor break (SENB) alarm, alarm 1 will be switched to ON state independent of the setting of A1FT. If A1FN is configured for dwell timer (TIMR), alarm 1 will not perform failure transfer.

**Alarm 2 failure transfer** is activated as the controller enters failure mode. Thereafter, alarm 2 will transfer to the ON or OFF state preset by A2FT.

**Exception:** If A2FN is configured for loop break (LB) alarm or sensor break (SENB) alarm, alarm 2 will be switched to ON state independent of the setting of A2FT. If A2FN is configured for dwell timer (TIMR), alarm 2 will not perform failure transfer.

---

**Failure mode occurs as:**

1. **SB1E**
2. **SB2E**
3. **ADER**

**Failure Transfer of output 1 and output 2 occurs as:**

1. Power start (within 2.5 seconds)
2. Failure mode is activated
3. Manual mode is activated
4. Calibration mode is activated

**Failure Transfer of alarm 1 and alarm 2 occurs as:**

Failure mode is activated

**Failure Transfer Setup:**

1. **O1FT**
2. **O2FT**
3. **A1FT**
4. **A2FT**
3–17 Bumpless Transfer

The bumpless transfer function is available for output 1 and output 2 (provided that OUT2 is configured as COOL).

Bumpless transfer is enabled by selecting BPLS for O1FT and/or O2FT and activated as one of the following cases occurs:

1. Power starts (within 2.5 seconds).
2. The controller enters failure mode. See section 3-16 for failure mode descriptions.
3. The controller enters manual mode. See section 3-22 for manual mode descriptions.
4. The controller enters calibration mode. See chapter 6 for calibration mode descriptions.

As bumpless transfer is activated, the controller will transfer to open-loop control and uses the previous averaging value of MV1 and MV2 to continue control.

When bumpless transfer is configured, the correct control variable is applied immediately as power is recovered, and the disturbance is small. During sensor breaks, the controller continues to control by using its previous value. If the load doesn’t change, the process will remain stable. If the load changes, the process may run away. Therefore, you should not rely on bumpless transfer for extended periods of time. For fail safe reasons, an additional alarm should be used to announce to the operator when the system fails. For example, a sensor break alarm, if configured, will switch to failure state and tell the operator to use manual control or take proper security action when the system enters failure mode.

**WARNING:** After the system fails, never depend on bumpless transfer for a long time, or it might cause the system to run away.

---

**Bumpless transfer setup:**
1. O1FT=BPLS
2. O2FT=BPLS

**Bumpless transfer occurs as:**
1. Power starts (within 2.5 seconds)
2. Failure mode is activated
3. Manual mode is activated
4. Calibration mode is activated

---

![Diagram of Bumpless Transfer](image)

Since the hardware and software need time to be initialized, the control is abnormal as the power is recovered and results in a large disturbance to the process. During the sensor breaks, the process loses power.

---

**Figure 3.21 Benefits of Bumpless Transfer**

---
3–18 Self tuning

Self-tuning provides an alternate option for tuning the controller. It is activated when YES is selected for SELF. When self-tuning is used, the controller will change its working PID values and compare the process behavior to previous cycles. If the new PID values achieve better control, then it changes the next PID values in the same direction. Otherwise, it changes the next PID values in the reverse direction. When an optimal condition is obtained, the PID values will be stored in PB1, TI1, and TD1, or PB2, TI2, and TD2, as determined by the event input conditions. See section 4-1. When self-tuning is completed, the value of SELF will change from YES to NONE to disable the self-tuning function.

When self-tuning is enabled, the control variables are tuned slowly so that the disturbance to the process is less than auto-tuning. Usually, self-tuning will perform successfully with no need to apply additional auto-tuning.

Exceptions: Self-tuning will be disabled as soon as one of the following conditions occurs:

1. NONE is selected for SELF.
2. The controller is used for on-off control (PB=0).
3. The controller is used for manual reset (TI=0).
4. The controller is in a loop break condition.
5. The controller is in failure mode (e.g., sensor break).
6. The controller is in manual control mode.
7. The controller is in sleep mode.
8. The controller is being calibrated.

If self-tuning is enabled, auto-tuning can still be used any time.

3–19 Auto tuning

The auto-tuning process is performed at the set point. The process will oscillate around the set point during the tuning process. Set the set point to a lower value if overshooting beyond the normal process value is likely to cause damage.

Auto-tuning is applied in cases of:
- Initial setup for a new process
- The set point is changed substantially from the previous auto-tuning value
- The control result is unsatisfactory

Operation:
1. The system has been installed normally.
2. Use the default values for PID before tuning. The default values are: PB1=PB2=18.0°F, TI1=TI2=100 seconds, TD1=TD2=25.0 seconds. Of course, you can use other reasonable values for PID before tuning according to your previous experiences. But don’t use a zero value for PB1 and TI1 or PB2 and TI2, otherwise, the auto-tuning program will be disabled.
3. Set the set point to a normal operating value or a lower value if overshooting beyond the normal process value is likely to cause damage.
4. Press (自称) until (自整) appears on the display.
5. Press (自整) for at least 3 seconds. The upper display will begin to flash and the auto-tuning procedure is beginning.

Self-tuning will use the auto-tuning results for its initial values.

Benefits of Self-tuning:
1. Unlike auto-tuning, self-tuning will produce less disturbance to the process.
2. Unlike auto-tuning, self-tuning doesn’t change the control mode during the tuning period. It always performs PID control.
3. Changing the set point during self-tuning is allowable. Therefore, self-tuning can be used for ramping set point control as well as remote set point control where the set point is changed from time to time.

Operation:
The parameter SELF is contained in the setup menu. Refer to section 1-5 to find SELF for initiating self-tuning.

NOTE:
Ramping function, remote set point, or pump function, if used, will be disabled once auto-tuning is proceeding.

Procedures:
Auto-tuning can be applied either as the process is warming up (cold start) or when the process has been in a steady state (warm start). See figure 3.22.

As the process reaches the set point value, the unit enters a waiting cycle. The waiting cycle elapses for a double integral time (TI1 or TI2, dependent on the selection, see section 4.1), then it enters a learning cycle. The double integral time is introduced to allow the process to reach a stable state. Before the learning cycle, the unit performs a pre-tune function with PID control. While in the learning cycle, the unit performs a post-tune function with an ON-OFF control. The learning cycle is used to test the characteristics of the process. The data is measured and used to determine the optimal PID values. At the end of the two successive ON-OFF cycles, the PID values are obtained and automatically stored in the nonvolatile memory. Once the auto-tuning procedures are completed, the process display will cease to flash and the unit will revert to PID control using its new PID values.
If auto-tuning begins near the set point (warm start), the unit skips the warm-up cycle and enters the waiting cycle. Afterward, the procedures are the same as described for cold start.

**Auto-Tuning Error**

If auto-tuning fails, an ATER message will appear on the upper display in the following cases:
- If PB exceeds 9000 (9000 PU, 900.0°F or 500.0°C);
- if TI exceeds 1000 seconds;
- if the set point is changed during the auto-tuning procedure;
- or if the event input state is changed so that the set point value is changed.

**Solutions to ATER**

1. Try auto-tuning again.
2. Don’t change the set point value during the auto-tuning procedure.
3. Don’t change the event input state during the auto-tuning procedure.
4. Use manual tuning instead of auto-tuning. (See section 3-20)
5. Touch any key to reset ATER message.
3–20 Manual Tuning

In certain applications (very few), when using both self-tuning and auto-tuning to tune a process proves inadequate for the control requirements, you can try manual tuning. Connect the controller to the process and perform the procedures according to the following diagram.

The manual tuning procedure may take a long time before reaching a new steady state since the P band was changed. This is particularly true for a slow process. As a result, the above manual tuning procedures will take from minutes to hours to obtain optimal PID values.

Table 3.2 PID Adjustment Guide

If the control performance using above tuning is still unsatisfactory, the following rules can be applied for further adjustment of PID values:

<table>
<thead>
<tr>
<th>ADJUSTMENT SEQUENCE</th>
<th>SYMPTOM</th>
<th>SOLUTION</th>
</tr>
</thead>
<tbody>

</tbody>
</table>

Figure 3.25 shows the effects of PID adjustment on process response.
3–21 Signal Conditioner DC Power Supply

Three types of isolated DC power supplies are available to supply an external transmitter or sensor. These are 20V rated at 25mA, 12V rated at 40mA and 5V rated at 80mA. The DC voltage is delivered to the output 2 terminals.

Caution:
To avoid damage, don’t use a DC power supply beyond its current rating. Purchase one with the correct voltage to suit your external devices. See the ordering code in section 1-2.

3–22 Manual Control

Manual control may be used for the following purposes:
1. To test the process characteristics to obtain a step response as well as an impulse response and use these data for tuning a controller.
2. To use manual control instead of a closed-loop control if the sensor fails or the controller’s A-D converter fails.
3. In certain applications, it is desirable to supply a process with a constant demand.

Operation:
Press [△] until [Hand] (hand control) appears on the display. Press [△] for 3 seconds, then the upper display will begin to flash and the lower display will show [Hand]. The controller is now in manual control mode. Press [△]; the lower display will show [H] and [C] alternately where [H] indicates output 1 (or heating) control variable value MV1 and [C] indicates output 2 (or cooling) control variable value MV2. Now you can use the up and down keys to adjust the percentage values for H or C.

The controller performs open loop control as long as it stays in manual control mode. The H value is exported to output 1 (OUT1) and C value is exported to output 2 provided that OUT2 is performing cooling function (i.e., COOL is selected for OUT2).

Exception
If OUT1 is configured as ON-OFF control (i.e., PB1=0 if PB1 is assigned or PB2=0 if PB2 is assigned by event input), the controller will never perform manual control mode.

Exiting Manual Control
Press [△] keys the and the controller will revert to its previous operating mode (may be a failure mode or normal control mode).

Means
MV1=38.4% for OUT1 (or heating)
MV2=7.63% for OUT2 (or cooling)
3–23 Display Mode

Operation

Press \( \text{[} \uparrow \text{]} \) \( \text{[} \downarrow \text{]} \) several times until \( \text{[} \downarrow \text{]} \text{ SP} \) (display) appears on the upper display. Then press \( \text{[} \downarrow \text{]} \) to enter display mode. You can select more parameters to view by pressing \( \text{[} \uparrow \text{]} \) or pressing \( \text{[} \rightarrow \text{]} \) to reverse sequence. The system mode of the controller and its operation will remain unchanged.

When the controller enters display mode, the upper display will show the parameter value and the lower display will show the parameter symbol except \( \text{[} \uparrow \text{]} \), \( \text{[} \downarrow \text{]} \), \( \text{[} \rightarrow \text{]} \), and \( \text{[} \leftarrow \text{]} \). \( \text{[} \rightarrow \text{]} \) shows the percentage value for output 1 and \( \text{[} \leftarrow \text{]} \) shows the percentage value for output 2 on the lower display while the upper display shows the current process value.

\( \text{PVHI}/\text{PVLO} \) show the historical extreme (maximum or minimum) values of the process on the upper display. The historical extreme values are saved in a nonvolatile memory even when it is unpowered. Press \( \text{[} \downarrow \text{]} \) for at least 6 seconds to reset both the historical values PVHI and PVLO to record new peak process values.

\( \text{MV1}/\text{MV2} \) show the process value on the upper display and \( \text{[} \uparrow \text{]} \) shows the percentage control value for output 1, while \( \text{[} \downarrow \text{]} \) shows the percentage control value for output 2.

\( \text{DV} \) shows the difference value between process and set point (i.e., PV-SV). This value is used to control output 1 and output 2.

\( \text{PV1} \) shows the process value of input 1 on the upper display.

\( \text{PV2} \) shows the process value of input 2 on the upper display.

\( \text{PB} \) shows the current proportional band value used for control.

\( \text{TI} \) shows the current integral time used for control.

\( \text{TD} \) shows the current derivative time used for control.

Since the controller is performing fuzzy control, the values of PB, TI, and TD may change from time to time.

\( \text{CJCT} \) shows the temperature at the cold junction, measured in °C independent of the unit used.

\( \text{PVR} \) Shows the changing rate of the process in °C (or °F or PU) per minute. It may be negative if the process is going down.

\( \text{PVRH}/\text{PVRL} \) The maximum and minimum changing rate of the process since power up, as measured in °C (or °F or PU) per minute. PVRH is a positive value while PVRL is a negative value.

**NOTE:** The controller will never revert to its PV/SV display from display mode unless you press the \( \text{[} \rightarrow \text{]} \text{ } \text{[} \leftarrow \text{]} \) keys.

3–24 Heater Current Monitoring

TEC99999, a current transformer, should be equipped to measure the heater current. Select CT for IN2. The input 2 signal conditioner measures the heater current while the heater is powered and the current value will remain unchanged while the heater is unpowered. PV2 will indicate the heater current. For information on how to read PV2 value, please refer to section 3-23.

**NOTES**

If the heater to be measured is controlled by output 1, then CYC1 should be set for 1 second or longer and O1TY should use RELY, SSRD, or SSR. Similarly, if the heater to be measured is controlled by output 2, then CYC2 should be set for 1 second or longer and O2TY should use RELY, SSRD, or SSR to provide an adequate time for the A to D converter to measure the signal. Since TEC99999 can detect a full-wave AC current only, a DC or half-wave AC current can’t be measured.

3–25 Reload Default Values

The default values listed in table 1.4 are stored in the memory when the product leaves the factory. On certain occasions, it is desirable to retain these values after the parameter values have been changed. Here is a convenient way to reload the default values.

**Operation**

Press \( \text{[} \uparrow \text{]} \text{[} \downarrow \text{]} \) several times until \( \text{[} \downarrow \text{]} \text{ DEFT} \) appears. Then press \( \text{[} \downarrow \text{]} \). The upper display will show \( \text{[} \rightarrow \text{]} \text{[} \leftarrow \text{]} \). Use the up and down keys to select 0 or 1. If °C units are required, select 0 for FILE and if °F units are required, select 1 for FILE. Then press \( \text{[} \downarrow \text{]} \) for at least 3 seconds. The display will flash for a moment(30,213),(811,383) while the default values are reloaded.

**CAUTION**

The procedure mentioned above will change the previous setup data. Before
Chapter 4  Full Function Programming

4–1 Event Input
Refer to section 2-10 for wiring an event input.
The event input accepts a digital type signal. Three types of signal, relay or switch contacts, open collector pull low, and TTL logic level can be used to switch the event input.
One of ten functions can be chosen by using [EIFN] (EIFN) in the setup menu.

NONE: Event input no function
If chosen, the event input function is disabled. The controller will use PB1, TI1, and TD1 for PID control and SP1 (or other values determined by SPMD) for the set point.

SP2: If chosen, the SP2 will replace the role of SP1 for control.

PID2: If chosen, the second PID set PB2, TI2, and TD2 will be used to replace PB1, TI1, and TD1 for control.

SP.P2: If chosen, SP2, PB2, TI2, and TD2 will replace SP1, PB1, TI1, and TD1 for control.

NOTE: If the second PID set is chosen during auto-tuning and/or self-tuning procedures, the new PID values will be stored in PB2, TI2, and TD2.

RS.A1: Resets alarm 1 as the event input is activated. However, if the alarm 1 condition is still existent, alarm 1 will be retrigged when the event input is released.

RS.A2: Resets alarm 2 as the event input is activated. However, if the alarm 2 condition is still existent, alarm 2 will be retrigged when the event input is released.

R.A1.2: Resets both alarm 1 and alarm 2 as the event input is activated. However, if alarm 1 and/or alarm 2 are still existent, alarm 1 and/or alarm 2 will be triggered again when the event input is released.

D.O1: Disables output 1 as the event input is activated.

D.O2: Disables output 2 as the event input is activated.

D.O1.2: Disables both output 1 and output 2 as soon as the event input is activated.

When any of D.O1, D.O2, or D.O1.2 are selected for EIFN, output 1 and/or output 2 will revert to their normal conditions as soon as the event input is released.

LOCK: All parameters are locked to prevent them from being changed. See section 4-13 for more details.

SP2F Function: Defines the format of SP2 value. If ACTU is selected for SP2F in the setup menu, the event input function will use the SP2 value for its second set point. If DEVI is selected for SP2F, the SP1 value will be added to SP2. The sum of SP1 and SP2 (SP1+SP2) will be used by the event input function for the second set point value. In certain applications, it is desirable to move the second set point value with respect to the value of set point 1. The DEVI function for SP2 provides a convenient way to do this.

4–2 Second Set Point
In certain applications it is desirable to have the set point change automatically, without the need to adjust it. You can apply a signal to the event input terminals (pin 17 and pin 16). The signal applied to the event input may come from a timer, a PLC, an alarm relay, a manual switch or other device. Select SP2 for EIFN, which is in the setup menu. This is available only when SP1.2, MIN.R, or HR.R is used for SPMD.

Application 1: A process is required to be heated to a higher temperature as soon as its pressure exceeds a certain limit. Set SPMD=SP1.2, EIFN=SP2 (or SP.P2 if the second PID is required for the higher temperature too). The pressure gauge is switched ON as it senses a higher pressure. Connect the output contacts of the pressure gauge to the event input. SP1 is set for a normal temperature and SP2 is set for a higher temperature. Choose ACTU for SP2F.

Application 2: An oven is required to be heated to 300°C from 8:00AM to 6:00PM. After 6:00PM it should be maintained at 80°C. Use a programmable 24 hour cycle timer for this purpose. The timer output is used to control the event input. Set SPMD=SP1.2, and EIFN=SP2 (or SP.P2 if the second PID is required to be used for the second set point). SP1 is set at 300°C and SP2 is set at 80°C. Choose ACTU for SP2F. After 6:00PM the timer output is closed. The event input function will then select SP2 (=80°C) to control the process.

Refer to section 4-1 for more descriptions about SP2F function.
4–3 Second PID Set

In certain applications the characteristics of a process are strongly related to its process value. The TEC-4300 provides two sets of PID values. When the process is changed to a different set point, the PID values can be switched to another set to achieve optimum conditions.

Auto-tuning second PID

The optimal PID values for a process may vary with its process value and set point. Hence if a process is used for a wide range of set points, dual PID values are necessary to optimize control performance. If the first PID set is selected (event input is not applied) during auto-tuning procedure, the PID values will be stored in PB1, TI1, and TD1. Similarly, if the second PID set is selected (event input is applied while PID2 or SP.P2 is selected for EIFN) during auto-tuning, the PID values will be stored in PB2, TI2, and TD2 as soon as auto-tuning is completed.

Application 1: programmed by the set point

Choose SP.P2 for EIFN. Both set point and PID values will be switched to another set simultaneously. The signal applied to the event input may come from a timer, a PLC, an alarm relay, a manual switch or other devices.

Application 2: programmed by the process value

If the process value exceeds a certain limit, 500°C for example, it is desirable to use another set of PID values to optimize control performance. You can use a process high alarm to detect the limit of the process value. Choose PV1H for A1FN, NORM for A1MD, adjust A1SP to be equal to 500°C, and choose PID2 for EIFN. If the temperature is higher than 500°C, then alarm 1 is activated. The alarm 1 output is connected to the event input, so the PID values will change from PB1, TI1, and TD1 to PB2, TI2, and TD2.

Refer to section 5-9 for more details.

4–4 Ramp and Dwell

Ramp

The ramping function is performed during power up as well as any time the set point is changed. Choose MINR or HRR for SPMD, and the unit will perform the ramping function. The ramp rate is programmed by using RAMP, which is found in the user menu.

Example without dwell timer

Select MINR for SPMD, °C for IN1U and set RAMP=10.0. SP1 is set to 200°C initially, then changed to 100°C 30 minutes after power up. The starting temperature is 30°C. After power up, the process runs like the curve shown below, ramping up or down by 10°C/minute.

![Figure 4.1 RAMP Function](image)

**Note:** When the ramp function is used, the lower display will show the current ramping value. However, it will revert to show the set point value as soon as the up or down key is pressed for adjustment. The ramping value is initiated as the process value either at power up or when RAMP and/or the set point are changed. Setting RAMP to zero means no ramp function at all.

Dwell

The dwell timer can be used separately or in conjunction with a ramp. If A1FN is set for TIMR, alarm 1 will act as a dwell timer. Similarly, alarm 2 will act as a dwell timer if A2FN is set for TIMR. The timer is programmed by using TIME which is in the user menu. The timer starts to count as soon as the process reaches its set point, and triggers an alarm when it times out. Here is an example.

Example without ramp

Select TIMR for A1FN, °F for IN1U and set TIME=30.0. SP1 is set to 400°F initially, and corrected to 200°F before the process reaches 200°F. As the process reaches the set point (i.e., 200°F), the timer starts to count. The TIME value can still be corrected without disturbing the timer before time out. TIME is changed to 40.0, 28 minutes after the process has reached its set point. The behavior of the process value and alarm 1 are shown below.

![Figure 4.2 Dwell Timer](image)
4–4 Ramp and Dwell, continued

Once the timer output is energized, it will remain unchanged until power down or an event input programmed for resetting the alarm is applied.

**Note:** TIMR can’t be chosen for A1FN and A2FN simultaneously, or an [Err 01] error code will result.

**Ramp and dwell**

A ramp may be accompanied with a dwell timer to control the process. Here is an example.

**Example with ramp and dwell**

Select HRR for SPMD, PU for IN1U, and set RAMP=60. Select TIMR for A2FN and set TIME=20.0. When power is applied, the process value starts at 0, SP1=30, and SP2=40. The timer output is used to control event input.

---

### 4–5 Remote Set Point

Selecting PV1 or PV2 for SPMD will enable the TEC-4300 to accept a remote set point signal. If PV1 is selected for SPMD, the remote set point signal is sent to input 1, and input 2 is used for the process signal input. If PV2 is selected for SPMD, the remote set point signal is sent to input 2, and input 1 is used for the process signal. To achieve this, set the following parameters in the setup menu.

**Case 1:** Use Input 2 to accept remote set point

**FUNC=FULL**

IN2, IN2U, DP2, IN2L, IN2H, are set according to remote signal.  
PVMD=PV1  
IN1, IN1U, DP1, are set according to the process signal  
IN1L, IN1H if available, are set according to the process signal  
SPMD=PV2

**Case 2:** Use Input 1 to accept remote set point

**FUNC=FULL**

IN1, IN1U, DP1, IN1L, IN1H, are set according to remote signal.  
PVMD=PV2  
IN2, IN2U, DP2, are set according to the process signal  
IN2L, IN2H if available, are set according to the process signal  
SPMD=PV1

**Note 1:** If PV1 is chosen for both SPMD and PVMD, an [Err 01] error code will appear. If PV2 is chosen for both SPMD and PVMD, an [Err 02] error code will appear. In either case, the TEC-4300 will not control properly.

**Note 2:** If PV1/PV2 is selected for SPMD, a signal loss will result in the controller reverting to manual mode with 0% output.

---

### 4–6 Differential Control

In certain applications it is desirable to control a second process such that its process value always deviates from the first process by a constant value. To achieve this, set the following parameters in the setup menu.

**FUNC=FULL**

IN1, IN1L, IN1H are set according to input 1 signal  
IN2, IN2L, IN2H are set according to input 2 signal  
IN1U, DP1, IN2U, DP2, are set according to input 1 and input 2 signal  
PVMD=P1-2 or P2-1  
SPMD=SP1.2

The response of PV2 will be parallel to PV1 as shown in the following diagram:

The PV display will indicate PV1-PV2 value if P1-2 is chosen for PVMD, or PV2-PV1 value if P2-1 is chosen for PVMD. If you need PV1 or PV2 to be displayed instead of PV, you can use the display mode to select PV1 or PV2 to be viewed. See section 3-23.

**Error messages**

If P1-2 or P2-1 is selected for PVMD, while PV1 or PV2 is selected for SPMD, an [Err 03] error code will appear. In this case the signals used for input 1 and input 2 should be the same unit and the same decimal point, that is, IN1U=IN2U, DP1=DP2, otherwise an [Err 05] error code will appear.
4–7 Output Power Limits

In certain systems the heater (or cooler) is over powered such that the process is too heavily heated or cooled. To avoid an excessive overshoot and/or undershoot you can use the power limit function. Output 1 power limit PL1 is contained in the user menu. If output 2 is not used for cooling (that is, COOL is not selected for OUT2), then PL2 is hidden. If the controller is used for ON-OFF control, then both PL1 and PL2 are hidden.

**Operation:**
Press \[ \text{[Power]} \] for 3 seconds, then press \[ \text{[Power]} \] several times to reach PL1 and PL2. PL1 and PL2 are adjusted by using the up and down keys with range of 0–100%.

**Example:**
OUT2=COOL, PB1=10.0°C, CPB=50, PL1=50, PL2=80%
Output 1 and output 2 will act as the following curves:

**NOTE:**
The adjustment range of MV1 (H) and MV2 (C) for manual control and/or failure transfer are not limited by PL1 and PL2.

---

4–8 Data Communication

Two types of interfaces are available for data communication. These are the RS-485 and RS-232 interfaces. Since RS-485 uses a differential architecture to drive and sense signal instead of a single ended architecture which RS-232 uses, RS-485 is less sensitive to noise and more suitable for communication over longer distances. RS-485 can communicate without error over a distance of 1km while RS-232 is not recommended for distances over 20 meters.

Using a PC for data communication is the most economical method. The signal is transmitted and received through the PC communication port (generally RS-232). Since a standard PC can't support an RS-485 port, a network adapter (such as TEC99001 or TEC99927) must be used to convert RS-485 to RS-232 for a PC if RS-485 is required for data communication. Up to 247 RS-485 units can be connected to one RS-232 port; therefore a PC with four comm ports can communicate with 988 units.

**Setup**
Enter the setup menu.
Select FULL (full function) for FUNC.
Select 485 for COMM if RS-485 is required, or 232 if RS-232 is required. Select RTU (i.e., Modbus protocol RTU mode ) for PROT. Set individual addresses for any units that are connected to the same port. Set the baud rate (BAUD), data bit (DATA), parity bit (PARI) and stop bit (STOP) so that these values are accordant with the PC setup conditions.

If you use a conventional 9-pin RS-232 cable instead of TEC99014, the cable should be modified for the proper operation of RS-232 communications according to section 2-16.
4–9 Analog Retransmission

Analog retransmission is available for model number TEC-4300-XXXXXXN where N=3, 4, or 5. See ordering code in section 1-2.

**Setup**

Select FULL for FUNC in the setup menu.
Select a correct output signal for COMM which should be accordant with the retransmission option used. Five types of retransmission output are available. These are: 4–20mA, 0–20mA, 0–5V, 1–5V and 0–10V. There are eight types of parameters that can be retransmitted according to the analog function (AOFN) selected. These are: PV1, PV2, PV1–PV2, PV2–PV1, SV, MV1, MV2 and PV–SV. Refer to table 1.4 for a complete description. Select a value for AOLO corresponding to output zero and select a value for AOHI corresponding to output SPAN.

**How to determine output signal:**

AOLO and AOHI are set to map to output signal low SL (e.g., 4mA) and output signal high SH (e.g., 20mA) respectively. The analog output signal AOS, corresponding to an arbitrary value of parameter AOV, is determined by the following curve.

\[
\text{AOLO} < \text{AOV} < \text{AOHI}
\]

**Formula:**

\[
\text{AOS} = \frac{\text{SH} - \text{SL}}{\text{AOHI} - \text{AOLO}} \cdot (\text{AOV} - \text{AOLO}) + \text{AOLO}
\]

**Figure 4.6 Conversion Curve for Retransmission**

**Notes:**

The setup values used for AOHI and AOLO must not be equal, otherwise, incorrect values will occur. However, AOHI can be set either higher or lower than AOLO. If AOHI is set higher than AOLO it will result in a direct conversion. If AOHI is set lower than AOLO it will result in a reverse conversion.

**Example**

A control uses a 4–20mA analog output to retransmit the difference value between input 1 and input 2 (PV1–PV2). It is required that if the difference value is -100, 4mA will be exported, and if the difference value is 100, 20mA will be exported. Make the following setup for TEC-4300:

\[
\text{IN1U=PU, DP1=NODP, IN2U=PU, FUNC=FULL, COMM=4-20, AOFN=P1-2, AOLO=-100, AOHI=100}
\]

4–10 Digital Filter

In certain applications the process value is too unstable to be read. A programmable low-pass filter incorporated in the TEC-4300 can be used to improve this. This is a first order filter with the time constant specified by the FILT parameter in the setup menu. The default value of FILT is set at 0.5 seconds. Adjust FILT to change the time constant from 0 to 60 seconds. 0 seconds means no filter is applied to the input signal. The filter is characterized by the following diagram.

**Figure 4.7 Filter Characteristics**

**Note**

The filter is available only for PV1, and is performed for the displayed value only. The controller is designed to use unfiltered signal for control even if the filter is applied.

4–11 Sleep Mode

**To enter sleep mode:**

Set FUNC for FULL to provide full function.
Select YES for SLEP to enable sleep mode.
Press \( \text{\textcopyright} \) for 3 seconds; the unit will now enter sleep mode.

**During sleep mode:**

1. All displays are shut off except a decimal point which is lit periodically.
2. All outputs and alarms are shut off.

**To exit sleep mode:**

1. Press \( \text{\textcopyright} \) to leave the sleep mode.
2. Disconnect the power.

The sleep function can be used in place of a power switch to reduce the system cost.

**Default:**

SLEP=None, sleep mode is disabled.

**Note:** If sleep mode is not required by your system, NONE should be selected for SLEP to disable sleep mode.
### 4–12 Pump Control

Pump control function is one of the unique features of the TEC-4300. Using this function, the pressure in a process can be excellently controlled. The pressure in a process is commonly generated by a pump driven by a variable speed motor. The complete system has the following characteristics which affect control behavior.

1. The system is very noisy.
2. The pressure changes very rapidly.
3. The pump characteristics are ultra nonlinear with respect to its speed.
4. The pump can’t generate any more pressure if its speed is lower than half of its rating speed.
5. An ordinary pump may slowly lose pressure even if the valves are completely closed.

Obviously, a conventional controller can’t fulfill the conditions mentioned above. Only the superior noise rejection capability in addition to the fast sampling rate possessed by the TEC-4300 can handle such an application.

To achieve this, set the following parameters in the setup menu:

- **FUNC=FULL**
- **EIFN=NONE**
- **PVMD=PV1**
- **SELF=NONE**
- **SPMD=PUMP**
- **SP2F=DEVI**

and program the following parameters in the user menu:

**Key menu**

- **REFC** = reference constant
- **SP2** = a negative value added to **SP1** to obtain the set point for the idle state

#### Programming guide:

1. Perform auto-tuning to the system under such conditions that pressure is exhausted at typical rate. A typical value for **PB1** is about 10Kg/cm², **TI1** is about 1 second, **TD1** is about 0.2 seconds.
2. If the process oscillates around the set point after auto-tuning, then increase **PB1** until the process can be stabilized at the set point. The typical value of **PB1** is about half to two times the range of the pressure sensor.
3. Increasing **FILT** (filter) can further reduce the oscillation amplitude on the display. But a value of **FILT** higher than 5 (seconds) is not recommended. A typical value for **FILT** is 0.5 or 1.
4. Close the valves and observe whether the controller can shut off the pump each time. The value of **REFC** should be adjusted as little as possible so that the controller can shut off the pump each time when all the valves are closed. A typical value for **REFC** is between 3 and 5.
5. An ordinary pump may slowly lose pressure even if the valves are completely closed. Adjust **SP2** according to the rule that a more negative value of **SP2** will allow the pump to be shut off for a longer time when the valves are closed. A typical value for **SP2** is about –0.50Kg/cm².

An example for pump control is given in section 5-1.

### Pump control features:

1. Minimum oscillation of pressure
2. Rapidly stabilized
3. Guaranteed pump stop
4. Programmable pump stopping interval

### 4–13 Remote Lockout

The parameters can be locked to prevent them from being changed by using either hardware lockout (see section 1-3), remote lockout, or both. If you need the parameters to be locked by using an external switch (remote lockout function), then connect a switch to terminals 17 and 16 (see section 2-10), and choose **LOCK** for **EIFN** (see section 4-1).

If remote lockout is configured, all parameters will be locked when the event input is closed. When the event input is left open, the lockout condition is determined by internal DIP switches, (hardware lockout, see section 1-3).

**Hardware lockout**: Can be used only during initial setup.

**Remote lockout**: Can be used any time.

#### Remote Lockout:

1. Connect external switch to terminal 10 and 11.
2. Set **LOCK** for **EIFN**
3. Lock all parameters
5-1 Pump/Pressure Control

Regulated water supply systems are widely used in residential areas, water plants, chemical plants, electrical plants, semiconductor plants, etc. By taking advantage of its PUMP function, the TEC-4300 can be used to create an economical yet versatile solution for these applications. Here is an example:

The water pressure in this example must be controlled at 10Kg/cm². To achieve this, the following devices are used for this example:

**Inverter**: To supply a variable frequency AC voltage to the motor.

**Motor**: A 3-φ induction motor.

**Pump**: Any appropriate economical type of pump.

**Pressure Sensor**: A three-wire or two-wire type of pressure transducer with a 0–20Kg/cm² range.

**Pressure Reservoir**: Provides smoother pressure for the system.

**TEC-4300**: Order a TEC-4300 with standard input, 4–20mA output 1, 20V DC output 2 for sensor power.

Set the following parameters in the setup menu:

- **FUNC=FULL**
- **COMM**: optional
- **IN1=4-20**
- **IN1U=PU**
- **DP1=2-DP**
- **IN1L=0**
- **IN1H=20.00**
- **IN2=NONE**
- **OUT1=REV**
- **O1TY=4-20**
- **O1FT=0**
- **OUT2=DCPS**
- **A1FN**: optional
- **EIFN=NONE**
- **PVMD=PV1**
- **FILT=1**
- **SELF=NONE**
- **SLEP=NONE**
- **SPMD=PUMP**
- **SP1L=5.00**
- **SP1H=15.00**
- **SP2F=DEVI**

Adjust the following parameters in the user menu:

- **A1SP**: optional
- **REFC=3**
- **PB1=10.00**
- **TI1=1**
- **TD1=0.2**
- **SP2=-0.50**
- **PL1=100**

Refer to section 4-12 for more details.
5–3 Heat Only Control
An oven is designed to dry the products at 150°C for 30 minutes and then stay unpowered for another batch. A TEC-4300 equipped with dwell timer is used for this purpose. The system diagram is shown at right:

To achieve this function, set the following parameters in the setup menu.

- **FUNC=BASC** (basic function)
- **IN1=K_TC**
- **IN1U=°C**
- **DP1=1_DP**
- **OUT1=REVR**
- **O1TY=RELY**
- **CYC1=18.0**
- **O1FT=0.0**
- **A1FN=TIMR**
- **A1FT=ON**
- **SELF=NONE**

Auto-tuning is performed at 150°C.

5–4 Cool Only Control
A TEC-4300 is used to control a refrigerator with the temperature below 0°C. To avoid set point adjustment beyond the desired range, SP1L is set at -10°C and SP1H is set at 0°C. Because the temperature is lower than the ambient, a cooling action is required, so select DIRT for OUT1. Since output 1 is used to drive a magnetic contactor, select RELY for O1TY. Because a small temperature oscillation is tolerable, use ON-OFF control to reduce the over-all cost. To achieve ON-OFF control, PB1 is set to zero and O1HY is set at 0.1°C.

**Figure 5.5 Heat Control Example**

**Figure 5.6 Cooling Control Example**
5–5 Heat-Cool Control

An injection mold is required to be controlled at 120°C to ensure a consistent quality for the parts. An oil pipe is buried in the mold. Since plastics are injected at a higher temperature (e.g., 250°C), the circulation oil needs to be cooled as its temperature rises. Here is an example:

PID heat-cool is used for the example at right.

To achieve this, set the following parameters in the setup menu:

- **FUNC=BASC**
- **IN1=PT.DN**
- **IN1U=°C**
- **DP1=1-DP**
- **OUT1=REVR**
- **O1TY=RELY**
- **CYC1=18.0 (seconds)**
- **O1FT=0.0**
- **OUT2=COOL**
- **O2TY=4–20**
- **O2FT=BPLS**
- **SELF=STAR**

Adjust **SP1** to 120.0°C, **CPB** to 125(%) and **DB** to -4.0(%).

Apply auto-tuning at 120°C for a new system to get optimal PID values. See section 3-19.

Adjustment of **CPB** is related to the cooling medium used. If water is used as the cooling medium instead of oil, the **CPB** should be set at 250(%). If air is used as the cooling medium instead of oil, the **CPB** should be set at 100(%). Adjustment of **DB** is dependent on the system requirements. A more positive value of **DB** will prevent unwanted cooling action, but will increase the temperature overshoot, while a more negative value of **DB** will achieve less temperature overshoot, but will increase unwanted cooling action.

5–6 Ramp and Dwell

**Example 1: Temperature cycling chamber**

A chamber is used to test the temperature cycling effect on personal computers. An external cycle timer is used to control the event input for switching the set point. The products under test are required to stay at 60°C for 1 hour and -10°C for 30 minutes. The transition interval between the high and low temperatures is required to be 5 minutes. Make the following setup:

- **EIFN=SP.P2**
- **A1FN=TIMR**
- **OUT1=REVR**, relay output
- **OUT2=COOL**, 4–20mA output
- **SPMD=MINR**
- **IN1U=°C**
- **DP1=1-DP**

The circuit diagram and its temperature profile are shown at right:
5–6 Ramp and Dwell continued…

The TEC-4300 provides a 4–20mA signal to control the speed of the inverter. SP.P2 is chosen for EIFN in order to create a dual PID control. You can perform autotuning twice at SP1 and SP2 for the initial setup for the dual PID values. Refer to sections 3-19 and 4-3.

Example 2: Programmable bread baking oven

Bread is baked in batches. A ramp is incorporated to control the thermal gradient to suit for making the bread. A dwell timer is used to shut off the oven power and announce this to the baker. The system is configured as shown in the diagram at right.

Push the ON switch to start a batch. The temperature will rise with a ramp rate determined by the RAMP value. The bread is baked with the set point temperature for a predetermined amount of time which is set in the TIME value, and then the power is shut off. The temperature profile is shown in the following figure.

![Figure 5.11 Temperature Profile of Baking Oven](image)

5–7 Remote Set Point

An on-line multiple zone oven is used to dry paint. Since heat demand varies at different positions in the production line, multiple zones with individual controls should be used to ensure a consistent temperature profile. If you order a TEC-4300 with a retransmission unit for the primary controller, and retransmit its set point to input 2 on the rest of the secondary controllers, each zone will be synchronized with the same temperature. At right is an example:

Set the following parameters in the setup menu:

<table>
<thead>
<tr>
<th>For the Primary units</th>
<th>For the Secondary Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>FUNC=FULL</td>
<td>FUNC=FULL</td>
</tr>
<tr>
<td>COMM=1–5V</td>
<td>IN2=1–5V</td>
</tr>
<tr>
<td>AIOLO=0ºC</td>
<td>IN2L=0ºC</td>
</tr>
<tr>
<td>AOHI=300ºC</td>
<td>IN2H=300ºC</td>
</tr>
<tr>
<td>PVMD=PV1</td>
<td>PVMD=PV1</td>
</tr>
<tr>
<td>SPMD=SP1.2</td>
<td>SPMD=PV2</td>
</tr>
</tbody>
</table>

If a voltage signal (such as in the above example) is sent to secondary units, the secondary inputs should be connected in parallel. If a current signal (e.g., 4–20mA) is sent to secondary units, the secondary inputs should be connected in series. Current retransmission is widely used because it can transmit over a longer distance without voltage drop.

Note: AOHI and IN2H should be set with values higher than the set point range used.
5–8 Differential Control

In certain applications it is desirable to control a second process so that its process value always deviates from the first process value by a constant amount. Water tank 1 is 5.12 meters in height, and the level in water tank 2 needs to be maintained at 1 meter lower than the tank 1 level.

Set the following parameters in the setup menu:

- **FUNC=FULL**
- **IN1, IN1L, IN1H:** According to sensor 1 signal
  - **IN1U=PU**
  - **DP1=2-DP**
- **IN2, IN2L, IN2H:** According to sensor 2 signal
  - **IN2U=PU**
  - **DP2=2-DP**
- **OUT1=REVR**
- **O1TY=4–20**
- **PVMD=P1-2**
- **SPMD=SP1.2**

Adjust SP1 (here it is 1.00) to control the difference between PV1 and PV2. Choose P1-2 for PVMD; the PV display will show the difference value (PV1-PV2) between PV1 and PV2, and this value will be stabilized to the set point (here it is 1.00). If you need PV1 or PV2 instead of PV, you can use the display mode to select PV1 or PV2 for display. See section 3-23. The above diagram indicates PV2 instead of PV.

5–9 Dual Set Point/PID

The TEC-4300 will switch between the two PID sets based on the process value, the set point, or either of the event inputs. As the control ramps up to the higher process value, the process characteristics change. When this happens, the original PID values are no longer valid. To achieve optimal control over the entire range, a second PID set is used.

**Example 1: Single set point/dual PID**

A heat treating furnace is used over the range of 400°C to 1200°C.

1. Set the following parameters in the setup menu:
   - **FUNC=FULL**
   - **A1FN=PV1H**
   - **A1MD=NORM**
   - **EIFN=PID2**
   - **PVMD=PV1**
   - **SPMD=MNR**

2. Adjust the following parameters in the user menu:
   - **A1SP=800°C**
   - **A1HY=1.0°C**
   - **PL1=100(%)**
   - **RAMP:** According to the process requirement
   - **SP1:** According to the process requirement

3. Tune the first PID set at SP1=50°C and tune the second PID set at SP1=1100°C, or set the proper values for PB1, TI1, TD1, PB2, TI2, and TD2 directly according to previous records to eliminate the auto-tuning sequence.

The circuit diagram and its temperature profile are shown at right:
Example 2: Dual set point/PID

A heat treating furnace is required to harden the mold at a high temperature (1000°C) for 30 minutes, then the mold is cooled down with a programmable ramp (20°C/minute) to a lower set point (200°C). Use the dual set point/PID and ramp/dwell functions for this application.

1. Set the following parameters in the setup menu:
   - FUNC=FULL
   - A1FN=TIMR
   - EIFN=SP.P2
   - PVMD=PV1
   - SPMD=MINR

2. Adjust the following parameters in the user menu:
   - TIME=30.0 (minutes)
   - RAMP=20.0 (°C/minute)
   - SP1=1000°C
   - SP2=200°C
   - PL1=100(%)”

3. Set the proper values for PB1, TI1, TD1, PB2, TI2, and TD2 directly according to previous records. For a new system, tune the first PID set at SP1=800°C and tune the second PID set at SP2=400°C.

The circuit diagram is the same as shown in figure 5.14. The temperature profile is shown above:

5–10 RS-485

A tile making plant has five production lines. Each production line is equipped with 16 TEC-4300 units to control the temperature for the kiln. They want to program the controllers and monitor the process from the control room to improve quality and productivity. A cost-effective solution for the above application would be to use 80 TEC-4300 units plus a TEC99001 smart network adapter and TEC99923 PC-based software for this purpose.

The system is installed as shown in the diagram at right.
5–10 **RS-485** continued…

**Setup**

Enter setup mode to configure each TEC-4300. Choose FULL for FUNC, 485 for COMM, RTU for PROT, and select a different address (ADDR) for each unit. Use the same values of BAUD, DATA, PARI, and STOP for the TEC-4300’s, TEC99002 and TEC99923. Also refer to section 2-15 and section 4-8.

Taking advantage of DAQ software, the operator can monitor the process on the PC screen, program the set point as well as other control parameters such as PID values, download the ramp and soak profile to the controllers, execute the manual control or trigger auto-tuning, etc., and print out reports as required. The historical data can be saved in the floppy drive, hard drive, or on a CD for permanent storage.

5–11 **RS-232**

Suppose a chemical experiment is performed in a laboratory and an engineer wants to find the relationship between the chemical reaction and temperature. He uses a TEC-4300 to control the temperature of the solution being tested. He is particularly interested in generating a test report containing the relationship between the concentration and temperature.

For a single unit application, it is adequate to order a TEC-4300 with RS-232 communication and TEC99923 software. Using the TEC99923 software, the temperature data can be viewed and stored in a file. The user can program the temperature as well as other control parameters such as PID values. He can set up the controller, download a ramp and soak profile, execute manual control or auto-tuning procedure, etc. The results can be printed out or stored in a file for future reference.

Refer to section 2-16 for installation and section 4-8 for setup procedure.

5–12 **Retransmit**

An air-conditioned room uses two TEC-4300 units to control the temperature and humidity. The temperature and humidity must be recorded on a chart recorder. The preferred ranges for these two parameters are: 20°C to 30°C and 40% RH to 60% RH. The recorder inputs accept a 0–5V signal.

To achieve this, set the following parameters in the setup menu.

<table>
<thead>
<tr>
<th>UNIT 1:</th>
<th>UNIT 2:</th>
</tr>
</thead>
<tbody>
<tr>
<td>FUNC=FULL</td>
<td>FUNC=FULL</td>
</tr>
<tr>
<td>COM=0–5V</td>
<td>COMM=0–5V</td>
</tr>
<tr>
<td>AOFN=PV1</td>
<td>AOFN=PV1</td>
</tr>
<tr>
<td>AOLO=20.0(°C)</td>
<td>AOLO=40.0(%)</td>
</tr>
<tr>
<td>AOHI=30.0(°C)</td>
<td>AOHI=60.0(%)</td>
</tr>
<tr>
<td>IN1=PTDN</td>
<td>IN1=0–1V (according to humidity sensor)</td>
</tr>
<tr>
<td>IN1U=°C</td>
<td>IN1U=PU</td>
</tr>
<tr>
<td>DP1=1-DP</td>
<td>DP1=1-DP</td>
</tr>
</tbody>
</table>

SP1L and SP1H are used to limit the adjustment range of the set point.

Chapter 6 Calibration

Do not proceed through this section unless there is a definite need to recalibrate the controller. If you do recalibrate, all previous calibration data will be lost. Do not attempt recalibration unless you have the appropriate calibration equipment. If the calibration data is lost, you will need to return the controller to your supplier who may charge you a service fee to recalibrate the controller.

Entering calibration mode will break the control loop. Make sure that the system is ready to enter calibration mode.

Equipment needed for calibration:
1. A high-accuracy calibrator (Fluke 5520A calibrator recommended) with the following functions:
   - 0–100mV millivolt source with ±0.005% accuracy
   - 0–10V voltage source with ±0.005% accuracy
   - 0–20mA current source with ±0.005% accuracy
   - 0–300 ohm resistant source with ±0.005% accuracy
2. A test chamber providing 25°C–50°C temperature range
3. A switching network (SW6400, optional for automatic calibration)
4. A calibration fixture equipped with programming units (optional for automatic calibration)

Manual Calibration Procedures

Perform step 1 to enter calibration mode.

**STEP 1**
Set the lockout DIP switch to the unlocked condition (both switches 3 and 4 are off).
Press both scroll and down keys and release them quickly. The operation mode menu will appear on the display. Repeat this operation several times until [RD] appears on the display. Press the scroll key for at least 3 seconds. The display will show [RD] and the unit will enter calibration mode. Output 1 and output 2 use their failure transfer values to control.
Perform step 2 to calibrate zero for the A to D converter and step 3 to calibrate the gain for the A to D converter.
The DIP switch should be set for T/C input.

**STEP 2**
Short terminals 19 and 20, then press the scroll key for at least 3 seconds. The display will blink for a moment until a new value is obtained. If the display didn’t blink or if the obtained value is equal to -360 or 360, then calibration failed.
Perform step 4 to calibrate the voltage function (if required) for input 1.

**STEP 3**
Press the scroll key until the display shows [RD]. Send a 60mV signal to terminals 19 and 20 with the correct polarity. Press the scroll key for at least 3 seconds. The display will blink for a moment until a new value is obtained. If the display didn’t blink or if the obtained value is equal to -199.9 or 199.9, then calibration failed.

**STEP 4**
Set the DIP switch for voltage input. Press the scroll key until the display shows [V]. Send a 10V signal to terminals 19 and 20 with the correct polarity. Press the scroll key for at least 3 seconds. The display will blink for a moment until a new value is obtained. If the display didn’t blink or if the obtained value is equal to -199.9 or 199.9, then calibration failed.
• Perform both steps 5 and 6 to calibrate RTD function (if required) for input 1.

**STEP 5**
Set the DIP switch for RTD input. Press the scroll key until the display shows [RTD]. Send a 100 ohms signal to terminals 18, 19, and 20 using the connection shown below:

![Figure 6.1 RTD Calibration](image)

Press the scroll key for at least 3 seconds. The display will blink for a moment; if it does not, calibration failed.

**STEP 6**
Press the scroll key and the display will show [5]. Change the ohm’s value to 300 ohms. Press the scroll key for at least 3 seconds. The display will blink for a moment while values are obtained for SR1 and REF1 (last step). If the display didn’t blink or if any value obtained for SR1 or REF1 is equal to -199.9 or 199.9, then calibration failed.

Perform step 7 to calibrate mA function (if required) for input 1.

**STEP 7**
Set the DIP switch for mA input. Press the scroll key until the display shows [mA]. Send a 20mA signal to terminals 19 and 20 with the correct polarity. Press the scroll key for at least 3 seconds. The display will blink for a moment until a new value is obtained. If the display didn’t blink or if the obtained value is equal to -199.9 or 199.9, then calibration failed.

Perform step 8 to calibrate voltage as well as CT function (if required) for input 2.

Calibration Continued On Next Page.
Manual calibration procedures continued…

Step 8
Press the scroll key until the display shows \( \text{[20\%]} \). Send a 10V signal to terminals 15 and 16 with the correct polarity. Press the scroll key for at least 3 seconds. The display will blink for a moment until a new value is obtained. If the display didn’t blink or if the obtained value is equal to -199.9 or 199.9, then calibration failed.

 Perform step 9 to calibrate mA function (if required) for input 2.

Step 9
Press the scroll key until the display shows \( \text{[50\%]} \). Send a 20mA signal to terminals 15 and 16 with the correct polarity. Press the scroll key for at least 3 seconds. The display will blink for a moment until a new value is obtained. If the display didn’t blink or if the obtained value is equal to -199.9 or 199.9, then calibration failed.

 Perform step 10 to calibrate offset of cold junction compensation, if required. Set the DIP switch for T/C input.

Step 10
Set up the equipment according to the following diagram to calibrate the cold junction compensation. Note that a K type thermocouple must be used.

![Diagram](attachment:diagram.png)

**Figure 6.2 Cold Junction Calibration Setup**

The 5520A calibrator is configured for K type thermocouple output with internal compensation. Send a 0.00°C signal to the unit under calibration. The unit under calibration is powered in a still-air room with a temperature of 25±3°C. Allow at least 20 minutes to warm up. The DIP switch is located at the TC input. Perform step 1 as stated above, then press the scroll key until the display shows \( \text{[50\%]} \). Press the up and down keys until a value of 0.1 is obtained. Press the scroll key for at least 3 seconds. The display will blink for a moment until the new value 0.0 is obtained. Otherwise, calibration failed.

**Caution:** It is **not recommended** to use step 11N, since the cold junction gain is not able to achieve the rated accuracy using this step.

 Perform step 11 to calibrate the gain of cold junction compensation if required. If a test chamber for calibration is not available, perform step 10N to use a nominal value for the cold junction gain.

Step 11
Set up the equipment the same as in step 10. The unit under calibration is powered in a still-air room with a temperature of 50±3°C. Allow at least 20 minutes to warm up. The calibrator source is set at 0.00°C with internal compensation mode.

Perform step 1 as stated above, then press the scroll key until the display shows \( \text{[50\%]} \). Press the up and down keys until a value of 0.0 is obtained. Press the scroll key for at least 3 seconds. The display will blink for a moment until the new value 0.0 is obtained. If the display didn’t blink or if the obtained value is equal to -199.9 or 199.9, then calibration failed. This setup is performed in a high temperature chamber, therefore it is recommended to use a computer to perform the procedures.

Step 11N
Perform step 1 as stated above, then press the scroll key until the display shows \( \text{[50\%]} \). Press the up and down keys until a value of 0.1 is obtained. Press the scroll key for at least 3 seconds. The display will blink for a moment until the new value 0.0 is obtained. Otherwise, calibration failed.

**Caution:** It is **not recommended** to use step 11N, since the cold junction gain is not able to achieve the rated accuracy using this step.

 Perform step 11 to calibrate the gain of cold junction compensation if required. If a test chamber for calibration is not available, perform step 10N to use a nominal value for the cold junction gain.

Final step
Step 12
Set the DIP switch to your desired position (refer to section 1-3).

Automatic calibration procedures
The programming port (see section 2-18) of the TEC-4300 can be used for automatic calibration.

The equipment required for automatic calibration is available upon request.
This procedure requires access to the circuitry of a unit under live power. Accidental contact with line voltage is possible. Only qualified personnel should perform these procedures. Potentially lethal voltages are present.

**Troubleshooting procedures:**

1. If an error message is displayed, refer to table 7.1 to see what caused it and what action to take to correct the problem.

2. Check each point listed below. Experience has proven that many control problems are caused by a defective instrument.
   - Line wires are improperly connected
   - No voltage between line terminals
   - Incorrect voltage between line terminals
   - Connections to terminals are open, missing, or loose
   - Thermocouple is open at tip
   - Thermocouple lead is broken
   - Shorted thermocouple leads
   - Short across terminals
   - Open or shorted heater circuit
   - Open coil in external contactor
   - Burned out line fuses
   - Burned out relay inside control
   - Defective solid-state relays
   - Defective line switches
   - Burned out contactor
   - Defective circuit breakers

3. If the points listed on the above chart have been checked and the controller still does not function properly, it is recommended that the instrument be returned to the factory for inspection. Do not attempt to make repairs without a qualified engineer and proper technical information, as damage may result. It is also recommended to use adequate packing materials to prevent damage during transportation.

4. Refer to table 7.2 for some probable causes and actions.

### Table 7.1 Error Codes and Corrective Actions

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Display Symbol</th>
<th>Error Description</th>
<th>Corrective Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Er01</td>
<td>Illegal setup values been used: PV1 is used for both PVMD and SPMD.</td>
<td>Error code 1. Check and correct setup values of PVMD and SPMD. PVM and SV can't use the same value for normal control.</td>
</tr>
<tr>
<td>2</td>
<td>Er02</td>
<td>Illegal setup values been used: PV2 is used for both PVMD and SPMD.</td>
<td>Same as error code 1.</td>
</tr>
<tr>
<td>3</td>
<td>Er03</td>
<td>Illegal setup values used: P1-2 or P2-1 is used for PVMD while PV1 or PV2 is used for SPMD. Dependent values used for PV and SV will create incorrect result of control.</td>
<td>Error code 2. Check and correct setup values of PVMD and SPMD. Difference of PV1 and PV2 can't be used for PV while PV1 or PV2 is used for SV.</td>
</tr>
<tr>
<td>4</td>
<td>Er04</td>
<td>Illegal setup values used: Before COOL is used for OUT2, DIRT (cooling action) has already been used for OUT, or PID mode is not used for OUT (that is, PB1 or PB2 = 0, and TI1 or TI2 = 0).</td>
<td>Error code 3. Check and correct setup values of OUT2, PB1, PB2, TI1, TI2 and OUT1. If OUT2 is required for cooling control, the control should use PID mode (PB = 0, TI = 0) and OUT1 should use reverse mode (heating action), otherwise, don't use OUT2 for cooling control.</td>
</tr>
<tr>
<td>5</td>
<td>Er05</td>
<td>Illegal setup values been used: unequal in1U and in2U or unequal DP1 and DP2 while P1-2 or P2-1 is used for PVMD or PV1 or PV2 is used for SPMD or P1.2, H, P1.2, L, D1.2, H or D1.2, L are used for A1FN or A2FN.</td>
<td>Error code 4. Check and correct setup values of IN1U, IN2U, DP1, DP2, PVMD, SPMD, A1FN or A2FN. Same unit and decimal point should be used if both PV1 and PV2 are used for PV, SV, alarm 1 or alarm 2.</td>
</tr>
<tr>
<td>6</td>
<td>Er06</td>
<td>Illegal setup values used: OUT2 select =AL2 but A2FN select NONE.</td>
<td>Error code 5. Check and correct setup values of OUT2 and A2FN. OUT2 will not perform alarm function if A2FN select NONE.</td>
</tr>
<tr>
<td>7</td>
<td>Er07</td>
<td>Illegal setup values used: Dwell timer (TIMR) is selected for both A1FN and A2FN.</td>
<td>Error code 6. Check and correct setup values of A1FN and A2FN. Dwell timer can only be properly used for single alarm output.</td>
</tr>
<tr>

  0-5.55V (0-5V, 1-5V), 0-11.1V (0-10V)

**User Interface**

- **Dual 4-digit LED displays:** Upper 0.55"(14mm), lower 0.4"(10mm)
- **Keypad:** 3 keys
- **Programming port:** For automatic setup, calibration, and testing
- **Communication port:** Connection to PC for supervisory control

**Control Mode**

- **Output 1:** Reverse (heating) or direct (cooling) action
- **Output 2:** PID cooling control, cooling P band 1–255% of PB
- **ON-OFF:** 0.1–100.0(°F) hysteresis control (P band=0)
- **P or PD:** 0–100.0% offset adjustment
- **PID:** Fuzzy logic modified
  - Proportional band 0.1–900.0°F
  - Integral time 0–1000 seconds
  - Derivative time 0–360.0 seconds
- **Cycle time:** 0.1–100.0 seconds
- **Manual control:** Heat (MV1) and cool (MV2)
- **Auto-tuning:** Cold start and warm start
- **Self-tuning:** Select NONE or YES
- **Failure mode:** Auto-transfer to manual mode while sensor break or A-D converter damage
- **Sleep mode:** Enable or disable
- **Ramping control:** 0–900.0°F/minute or 0–900.0°F/hour ramp rate
- **Power limit:** 0–100% output 1 and output 2
- **Pump/pressure control:** Sophisticated functions provided
- **Remote set point:** Programmable range for voltage or current input
- **Differential control:** Control PV1-PV2 at set point

**Digital Filter**

- **Function:** First order
- **Time constant:** 0, 0.2, 0.5, 1, 2, 5, 10, 20, 30, 60 seconds programmable

**Environmental and Physical**

- **Operating temperature:** 10°C to 50°C
- **Storage temperature:** 40°C to 60°C
- **Humidity:** 20 to 90%RH (non-condensing)
- **Insulation resistance:** 20Mohmsmin.(at500VDC)
- **Dielectric strength:** 2000VAC,50/60Hzfor1minute
- **Vibration resistance:** 10–55Hz,10m/sfor2hours
- **Shock resistance:** 200m/s(20g)
- **Moldings:** Flameretardantpolycarbonate
- **Dimensions:** 96mm(W)X96mm(H)X65mm(D), 55mmdepthbehindpanel

- **Weight:** 255grams

**Approval Standards**

- **Safety:** UL873 (11th edition, 1994), EN61010-1 (IEC1010-1)
- **Protective class:** IP 20 housing and terminals with protective covers
- **EMC:** EN61326
## A-1 Menu Existence Conditions
