TEC-910
High Limit Control
Microprocessor Based Limit Controller
Warning Symbol

This symbol calls attention to an operating procedure, practice, or the like which, if not correctly performed or adhered to, could result in personal injury or damage to or destruction of part or all of the product and system. Do not proceed beyond a warning symbol until the indicated conditions are fully understood and met.

Information in this user's manual is subject to change without notice.

Chapter 1 Overview

1–1 General

The TEC-910 limit control is an over temperature protection or a high limit safety device with a latching output that removes power in an abnormal condition when the process temperature is higher than the high limit set point or lower than the low limit set point.

The unit is powered by 11–26 or 90–264VDC/VAC supply, voltage incorporates a 2 amp form C relay for limit control, a universal input which is fully programmable for thermocouple types J, K, T, E, B, R, S, N, L, and 0-60mV, and an option port is available for one of the following functions: RS-232, RS-485 communication interface and Retransmission. The input signal is digitized by using an 18-bit Analog to Digital converter. Its fast sampling rate (5 times/second) allows the TEC-910 to control fast processes such as pressure and flow in addition to temperature.

RS-485 digital communication is available as an additional option. This option allows the TEC-910 to be integrated with a supervisory control system. An alarm output is another option. A variety of alarm functions and alarm modes can be programmed for a specific application. The DC power supply output option is used for an external sensor or transmitter. The standard event input option can be programmed for remote reset or remote lock out signal input. The limit annunciator option can be used to control an alarm buzzer.

Three different methods can be used to program the TEC-910.

1. Use the keys on the front panel to program the unit manually
2. Use a PC and setup software to program the unit via the RS-485 port.
3. Use a PC and configuration software to program the unit via the programming port.

High accuracy, maximum flexibility, fast response, and user friendly operation are the main features of the TEC-910 high limit controller.

1–2 Hardware Code

**NOTE:** A part number based on the hardware code and any software pre-programming will be issued at time of order.

**TEC-910 –**

1. 2. 3. 4.

**Power Input**

4 = 90-264 Vac, 47-63 Hz  
5 = 11-26 Vac or Vdc

**Signal Input**

1 = Standard Input  

**Option**

0 = None  
1 = Form A Relay: 2A/240 Vac  
6 = Triac Output, 1A/240 Vac SSR  
7 = Isolated 20V @ 25 mA DC Output Power Supply  
8 = Isolated 12V @ 40 mA DC Output Power Supply  
9 = Isolated 5V @ 80 mA DC Output Power Supply  
A = RS-485  
B = Event Input  
C = Pulsed voltage to drive SSR: 14V/40mA  
D = Retransmit 4-20mA/0-20mA  
E = Retransmit 1-5V/0-5V  
F = Retransmit 0-10V

**Output 1**

1 = Form C Relay: 2A / 240 Vac  
6 = Triac output: 1A / 240 Vac, SSR

* **WARNING** *

Sensor failure will not be detected unless using thermocouple inputs.

**Accessories**

- TEC99001 = Smart Network Adapter for third party software, converts 255 channels of RS-485 or RS-422 to RS-232 Network  
- TEC99012 = Programming Cable  
- TEC99003 = Smart Network Adapter for programming port to RS-232 interface  
- TEC99030 = Configuration Software

The use of solid state relays/contactors are highly discouraged for high limit safety circuits as solid state devices can fail in the closed position.
1–3 Programming Port

The programming port is used for off-line automatic setup and testing procedures only. Don't attempt to make any connection to these pins when the unit is actively being used in a control application.

Figure 1.1
Programming Port Location

The programming port is used for off-line automatic setup and testing procedures only. Don't attempt to make any connection to these pins when the unit is actively being used in a control application.

1–4 Keys and Displays

KEYPAD OPERATION

SCROLL KEY:  
1. Select a set point to be displayed.
2. Select a parameter to be viewed or adjusted.
3. Advance display from a parameter code to the next parameter code.

ENTER KEY:  
Press the enter key for 4 seconds to enter the setup menu.
Press the enter key for 8 seconds to enter the calibration mode.

UP KEY:  
This key is used to increase the selected parameter value when the lock indicator is off.

DOWN KEY:  
This key is used to decrease the selected parameter value when the lock indicator is off.

RESET KEY:  
This key is used to:
1. Revert the limit condition after the process is within the limit.
2. Revert the display to the normal display.
3. Reset the latching alarm, once the alarm condition is removed.
4. Reset the limit annunciator.

Note:
If the RESET key is left pressed, only ONE reset operation will occur. If the unit subsequently goes into a state where reset is required again, the RESET key (or remote reset contacts) must be released (opened) and pressed (closed) again.

UNLOCK KEY:  
Press the RESET key for 4 seconds to enable up/down key function, reset the reference data (section 3-13) and extinguish the lock indicator. However, this function is disabled when “remote lock” is selected for EIFN (Event Input Function). See section 3-11.
How to display a 5-digit number:

For a number with a decimal point, the display will be shifted one digit to the right:
-199.99 will be displayed as -199.9, 4553.6 will be displayed as 4553

For a number without a decimal point, the display will be divided into two alternating phases:

-19999 will be displayed as
45536 will be displayed as
-9999 will be displayed as
NORMAL DISPLAY
During normal operation, the unit will display the process value and the word SAFE.

ABNORMAL DISPLAY
Whenever the process is outside the normal range, the display will display the limit set point value, instead of displaying the word SAFE.

SENSOR BREAK DISPLAY
If a break is detected in the sensor circuit, the display will show:

$SEnb$

A-D FAILURE DISPLAY
If a failure is detected in the A-D converter circuit, the display will show:

$AdEr$
POWER UP SEQUENCE

Verify that all electrical connections have been made properly before applying power to the unit.

During power up, a self-test procedure will be performed within 6.5 seconds. During the self-test period all outputs are left off. When the self-test procedure is complete, the unit will revert to normal operation.

Figure 1.3
Power Up Sequence

All segments of display and indicators are left off for 0.5 seconds.

All segments of display and indicators are lit for 1 second.

Displays program code of the product for 1 second. The diagram at left shows program no.1 with version 21.

Displays date code for 1 second. This diagram shows year 2001, month February, date 25th. This means that the product was produced on February 25th, 2001. Note the month code is A for October, B for November and C for December.

Displays the serial number (001-999) for 1 second.

Displays the hours used for 2 seconds. The diagram at left shows that this unit has been used for 23456.7 hours since production.
**Note 1.** The flow charts show a complete listing of parameters. For the actual application, the number of available parameters are dependent on the setup conditions, and should be less than that shown in the flow charts.

**Note 2.** Press [R] key for 4 seconds to enable up/down key function and extinguish the LOCK indicator.
1–6 Limit Control Operation

HIGH LIMIT OPERATION

If Hi. is selected for OUT1, the unit will perform high limit control. When power is applied the OUT1 relay is de-energized. After the 6.5 second self-test period, if the process is below the high limit set point (HSP1) the output 1 relay will be energized and the OP1 indicator will go off. If the process goes above the high limit set point, the relay will be de-energized, the OP1 indicator will go on, and the display will show the process value. After the process falls below the high limit set point and the R key is pressed or the remote reset input is applied, the relay will be energized and the OP1 indicator will go off.

LOW LIMIT OPERATION

If Lo. is selected for OUT1, the unit will perform low limit control. When power is applied the OUT1 relay is de-energized. After the 6.5 second self-test period, if the process is above the low limit set point (LSP1) the output 1 relay will be energized and the OP1 indicator will go off. If the process goes below the low limit set point, the relay will be de-energized, the OP1 indicator will go on, and the display will show the process value. After the process rises above the low limit set point and the R key is pressed or the remote reset input is applied, the relay will be energized and the OP1 indicator will go off.

HIGH/LOW LIMIT OPERATION

If Hi.Lo is selected for OUT1, the unit will perform high/low limit control. When power is applied, the OUT1 relay is de-energized. After the 6.5 second self-test period, if the process is below the high limit set point (HSP1) and above the low limit set point (LSP1), the output 1 relay will be energized and the OP1 indicator will go off. If the process goes above the high limit set point or below the low limit set point, the relay will be de-energized, the OP1 indicator will go on, and the display will show the process value. After the process is within the normal operation range, and the R key is pressed or the remote reset input is applied, the relay will be energized and the OP1 indicator will go off.

* WARNING *
Sensor failure will not be detected during Low-Limit Operation.

Dangerous voltages capable of causing death are sometimes present in this instrument. Before installation or beginning any troubleshooting procedures, the power to all equipment must be switched off and isolated. Units suspected of being faulty must be disconnected and removed to a properly equipped workshop for testing and repair. Component replacement and internal adjustments must be made by a qualified maintenance person only.

To minimize the possibility of fire or shock hazards do not expose this instrument to rain or excessive moisture.

Do not use this instrument in areas under hazardous conditions such as excessive shock, vibration, dirt, moisture, corrosive gases or oil. The ambient temperature of the area should not exceed the maximum rating specified in chapter 5.

2–1 Unpacking
Upon receipt of the shipment, remove the unit from the carton and inspect the unit for any shipping damage. If there is any damage due to transit, report it and file a claim with the carrier. Write down the model number, serial number and date code. for future reference when corresponding with our Service Department. The serial number (SN) and date code (D/C) are labeled on the box and the housing of the unit.

2–2 Mounting
Make the panel cutout according to the dimensions shown in figure 2.1. Remove the mounting clamps and screws and insert the controller into the panel cutout. Reinstall the mounting clamp and screws. Gently tighten the screws until the front panel fits snugly in the cutout.

Figure 2.1 Mounting Diagram

2–3 Wiring Precautions
• Before wiring, verify the correct model number and options on the label. Switch off the power while checking.
• Care must be taken to ensure that the maximum voltage rating specified on the label is not exceeded.
• It is recommended that the power for these units be protected by fuses or circuit breakers rated at the minimum value possible.
• All units should be installed in a suitable enclosure to prevent live parts from being accessible to human hands and metal tools. Metal enclosures and/or subpanels should be grounded in accordance with national and local codes.
• All wiring must conform to appropriate standards of good practice and local codes and regulations. Wiring must be suitable for the voltage, current, and temperature rating of the system.
• Beware not to over-tighten the terminal screws. The torque should not exceed 1 N-m (8.9 lb-in or 10 KgF-cm).
• Unused control terminals should not be used as jumper points as they may be internally connected, causing damage to the unit.
• Verify that the ratings of the output devices and the inputs as specified are not exceeded.
• Except for thermocouple wiring, all wiring should use stranded copper conductor with a maximum gage of 14 AWG.
• Electrical power in industrial environments contains a certain amount of noise in the form of transient voltage and spikes. This electrical noise can adversely affect the operation of microprocessor-based controls. For this reason the use of shielded thermocouple extension wire which connects the sensor to the controller is strongly recommended. This wire is a twisted-pair construction with foil wrap and drain wire. The drain wire is to be attached to ground in the control panel only.

Notes: 50°C max. air ambient
Use copper conductors (except on T/C input) ASTM thermocouples (USA), the red colored lead is always negative.

Figure 2.3 Rear Termination Connection Diagram
2–4 Power Wiring

The controller is designed to operate at 11–26V AC/VDC to 90–264V AC. Check that the installation voltage corresponds to the power rating indicated on the product label before connecting power to the controller. Near the controller a fuse and a switch rated at 2A/264VAC should be equipped as shown in Figure 2-4.

⚠️ This equipment is designed for installation in an enclosure which provides adequate protection against electric shock. The enclosure must be connected to earth ground.

Local requirements regarding electrical installation should be rigidly observed. Consideration should be given to prevent unauthorized personnel from accessing the power terminals.

2–5 Sensor Installation Guidelines

Proper sensor installation can eliminate many problems in a control system. The probe should be placed so that it can detect any temperature change with minimal thermal lag. In a process that requires fairly constant heat output, the probe should be placed close to the heater. In a process where the heat demand is variable, the probe should be close to the work area. Some experimentation with probe location is often required to find the optimum position.

In a liquid process, the addition of agitation will help to eliminate thermal lag. Since the thermocouple is basically a point measuring device, placing more than one thermocouple in parallel will provide an average temperature readout and produce better results in most air heated processes.

Proper sensor type is also a very important factor in obtaining precise measurements. The sensor must have the correct temperature range to meet the process requirements. In special processes, the sensor might have requirements such as leak-proof, anti-vibration, antiseptic, etc.

Standard sensor limits of error are ±4°F (±2°C) or 0.75% of the sensed temperature (half that for special limits of error) plus drift caused by improper protection or an over-temperature occurrence. This error is far greater than controller error and cannot be corrected on the sensor except by proper selection and replacement.

2–6 Thermocouple Input Wiring

Thermocouple input connections are shown in figure 2-5. The correct type of thermocouple extension lead-wire or compensating cable must be used for the entire distance between the unit and the thermocouple, ensuring that the correct polarity is observed throughout. Junction/terminal blocks or splices in the cable run should be avoided, if possible.

If the length of the thermocouple plus the extension wire is too long, it may affect the temperature measurement. A 400 ohms K type or a 500 ohms J type thermocouple lead resistance will produce approximately 1°C temperature error.
The event input can accept a switch signal as well as an open collector signal. The event input function (EIFN) is activated as the switch is closed or an open collector (or a logic signal) is pulled down.

**Figure 2.9**
Event Input Wiring

**Figure 2.10**
Output 1 Wiring

Figure 2.11
Output 2 Wiring
Figure 2.12
RS-485 Wiring
Chapter 3  Programming

3–1 Process Input

Press \( \text{\textbullet} \) for 4 seconds and release to enter the setup menu. Press \( \text{\textbullet} \) to select parameter. The display will indicate the parameter symbol and the value (or selection) for that parameter.

INPT: Selects the sensor type and signal type for the process input.

UNIT: Selects the process unit

RESO: Selects the location of the decimal point (Resolution) for most (not all) process related parameters.

3–2 Limit Control

**OUT1:** Selects the output 1 function. The available output 1 functions are: High Limit Control, Low Limit Control, and High/Low Limit Control. Refer to section 1-6 for limit control operation.

**O1.HY:** Output 1 hysteresis value. The hysteresis value is adjusted to a value to eliminate relay jitter in a noisy environment.

*WARNING*

Sensor failure will not be detected unless using thermocouple inputs. High Limit may not function.
3–3 Set Point Range

**HSP.L**: Lower limit of HSP1. Hidden if LO is selected for OUT1

**HSP.H**: Upper limit of HSP1. Hidden if LO is selected for OUT1

**LSP.L**: Lower limit of LSP1. Hidden if HI is selected for OUT1

**LSP.H**: Upper limit of LSP1. Hidden if HI is selected for OUT1

HSP.L and HSP.H in the setup menu are used limit the adjustment range of HSP1. LSP.L and LSP.H are used to limit the adjustment range of LSP1.

3–4 PV Shift

In certain applications it is desirable to shift the controller display value (PV) from its actual value. This can be easily accomplished with this control by using the PV shift function.

Cycle the unit to the SHIF parameter by using the scroll key in setup menu. The number you adjust, either positive or negative, will be added to the actual value. The SHIF function will alter the process variable (PV) only.

**SHIF**: PV shift (offset) value

3–5 Digital Filter

In certain applications the process value is too unstable to be read. To improve this, a programmable low pass filter is incorporated in the TEC-910. This is a first order filter with the time constant specified by the FILT parameter which is found in the setup menu. The default value of FILT is set at 0.5 seconds before the unit is shipped. Adjust FILT to change the time constant from 0 to 60 seconds. 0 seconds means no filter is applied to the input signal. The filter is characterized by Figure 3-2 below.

![Figure 3.2 Filter Characteristics](image-url)
3–6 Process Alarms

If Output 2 is designated as an “Alarm Output”, the alarm function, AL.FN can be setup for Process Value High Alarm, PV.H.A or Process Value Low Alarm, PV.L.A. The process alarm sets an absolute trigger level. When the process exceeds that absolute trigger level, an alarm occurs. The trigger level is determined by the setting of the set point 2 value SP2 and the alarm hysteresis value AL.HY. The hysteresis value is introduced to avoid interference in a noisy environment. Normally, AL.HY can be set with a minimum value 0.1.

The trigger levels for the process high alarm are SP2 and SP2-AL.HY. The trigger levels for the process low alarm are SP2+AL.HY and SP2.

There are two types of alarm mode, AL.MD that can be selected. They are Normal Alarm (NORM) and Latching Alarm (LATCH).

Normal Alarm: AL.MD=NORM

When the normal alarm is selected, the alarm output is de-energized in the non-alarm condition and energized in an alarm condition.

Latching Alarm: AL.MD=LTCH

If the latching alarm is selected, once the alarm output is energized, it will remain unchanged even if the alarm condition has been cleared, unless the power is shut off or the RESET key (or remote reset button) is pressed.

Failure Transfer: AL.FT=OFF or ON

If a Sensor Break or an A-D Failure occurs, the alarm output will be on or off according to the setting of AL.FT.

Examples:

<table>
<thead>
<tr>
<th>SP2=200</th>
<th>AL.HY=10.0</th>
<th>AL.MD=NORM</th>
<th>AL.FN=PV.H.A</th>
</tr>
</thead>
</table>

![Figure 3.3 Normal Process Alarm](image1)

![Figure 3.4 Latching Process Alarm](image2)
3–7 RS-485 Communication

Using a PC for data communication is the most economical method. The signal is transmitted and received through the PC communication port (generally RS-232). Since a standard PC can't support an RS-485 port, a network adapter (such as SNA10A, SNA10B) has to be used to convert RS-485 to RS-232 for a PC if RS-485 is required for data communication. Many RS-485 units (up to 247 units) can be connected to one RS-232 port. This means that a PC with 4 comm ports can communicate with up to 988 units.

Select COMM for OUT2 in setup menu; output 2 will perform RS-485 interface with Modbus RTU mode protocol.

Setup
1. Select COMM for OUT2
2. Set a different address (ADDR) for each unit which is connected to the same port.
3. Set the baud rate (BAUD) and parity bit (PARI) values according to the setup of the PC.

3–8 Display Mode

The DISP in the setup menu is used to select the display format for normal conditions. If PV is selected, the display will indicate the process value. If SP1 is selected, the display will indicate HSP1 value for high limit control (OUT1=HI) and high/low limit control (OUT1=HI.LO) or indicate LSP1 value for low limit control (OUT=LO). If SAFE is selected, the display will indicate the word SAFE for normal conditions.

However, if the process value goes beyond high limit or low limit, the display will indicate the process value. If an error condition occurs, the display will indicate the error symbol.
3-9 Signal Conditioner DC Power Supply

Three types of isolated DC power supplies are available to supply an external transmitter or sensor. These are 20V rated at 25mA, 12V rated at 40mA, and 5V rated at 80mA. DC voltage is delivered to the output 2 terminals by selecting DCPS for OUT2 in the setup menu.

**Caution:**
To avoid damage, don't use the DC power supply beyond its rating current. Purchase a power supply with the correct voltage to suit your external devices. See ordering code in section 1-2.

3-10 Remote Reset

If REST is selected for the Event Input Function EIFN, terminals 16 and 17 will act as remote reset input. Pressing the remote reset button will perform the same function as pressing the RESET key. Refer to section 1-4 for RESET key function.
### 3-11 Remote Lock

If LOCK is selected for Event Input Function EIFN, terminals 16 and 17 will act as remote lock input. Turning the remote lock switch on will keep all the parameter settings from being changed. If the switch is opened the lock indicator is extinguished and the up/down key is enabled.

#### Figure 3.7 Remote Lock Application

- Remote Lock

#### Setup

- OUT2 = EIFN
- EIFN = LOCK

### 3-12 Limit Annunciator

If Output 2 is designated as an Limit Annunciator, L_AN the output relay will track the Limit setpoint. If the limit setpoint is or has been reached by the process value, then the limit annunciator will be energized and the OP2 indicator LED will be lit and remain unchanged until the reset key or remote reset input is applied.

### 3-13 Reference Data

There are three reference data points stored by the control and accessed in the setup menu. The reference data are read-only data. The maximum historical PV, displayed by $PV_{Hi}$, which shows the maximum process value since the last UNLOCK operation. The minimum historical PV, displayed by $PV_{Lo}$, shows the minimum process value since the last UNLOCK operation. The abnormal time, displayed by $T.ABN$, which shows the total accumulated time (minutes) during the process which has been in abnormal condition since the last UNLOCK operation.

The values of the reference data will be initiated as soon as the RESET key is pressed for 4 seconds (UNLOCK operation). After the UNLOCK operation, the PV.HI and PV.LO values will start from the current process value and T.ABN value will start from zero.
An oven uses a single phase heater to heat the process. A single loop temperature control TEC-9100 is used to regulate the temperature. A TEC-910 limit control is used to protect the process from being overheated. The wiring diagram is shown below.

![Wiring Diagram](image-url)

Chapter 5 Specifications

Power
90–264VAC, 49–63 Hz, 10VA, 5W maximum
11–26VAC/VDC, 10VA, 5W maximum

Input
Resolution: 18 bits
Sampling rate: 5 times/second
Maximum rating: -2VDC minimum, 12VDC maximum
(1 minute for mA input)

Temperature effect: ±1.5uV/°C
Sensor lead resistance effect:
T/C: 0.2uV/ohm

Burn-out Current: 200nA
Common Mode Rejection Ratio (CMRR): 120dB
Sensor Break Detection:
Sensor open for TC and mV inputs.
Sensor break responding time:
Within 4 seconds for TC.

Triac (SSR) Output
Rating: 1A/240VAC
Inrush Current: 20A for 1 cycle
Min. Load Current: 50mA rms
Max. Off-state Leakage: 3mA rms
Max. On-state Voltage: 1.5V rms
Insulation Resistance: 1000Mohms min. at 500VDC
Dielectric Strength: 2500VAC for 1 minute
Data Communication
Interface: RS-232 (1 unit), RS-485 (up to 247 units)
Protocol: Modbus protocol RTU mode
Address: 1–247
Baud Rate: 0.3–38.4 Kbits/sec
Data Bits: 8 bits
Parity Bit: None, even or odd
Stop Bit: 1 or 2 bits
Communication Buffer: 50 bytes

Environmental and Physical
Operating temperature: 14° to 122°F (-10°C to 50°C)
Storage temperature: -40° to 140°F (-40°C to 60°C)
Humidity: 0 to 90% RH (non-condensing)
Insulation resistance: 20 Mohms min. (at 500VDC)
Dielectric strength: 2000VAC, 50/60 Hz for 1 minute
Vibration resistance: 10–55 Hz, 10 m/s² for 2 hours
Shock resistance: 200m/s² (20g)
Moldings: Flame retardant polycarbonate
Dimensions: 1-7/8" × 1-7/8" × 3-3/4" H × W × D
(48 × 48 × 94 mm)
Depth behind panel: 3-3/8" (86 mm)
Weight: .33 lbs. (150 grams)

Approval Standards
Safety: FM Class 3534 (Oct. 1998)
UL873 (11th edition, 1994)
CSA C22.2 No. 24-93
EN61010-1 (IEC1010-1)

User Interface
4-digit LED Displays: 0.4" (10 mm)
Keypad: 4 keys
Programming Port: For automatic setup, calibration, and testing.
Communication Port: Connection to PC for supervisory control.

Limit Control: High limit only.

Digital Filter
Function: First order
Time Constant: 0, 0.2, 0.5, 1, 2, 5, 10, 20, 30, 60 seconds programmable

EMC: EN61326
Chapter 6 Modbus Communications

This chapter specifies the Modbus Communications protocol as RS-232 or RS-485 interface module is installed. Only RTU mode is supported. Data is transmitted as eight-bit binary bytes with 1 start bit, 1 stop bit and optional parity checking (None, Even or Odd). Baud rate may be set to 300, 600, 1200, 2400, 4800, 9600, 14400, 19200, 28800 and 38400.

6-1 Functions Supported

Only function 03, 06 and 16 are available for this series of controllers. The message formats for each function are described as follows:

**Function 03: Read Holding Registers**

**Query:** (from Master)  
Slave address (0-255)  
Function code (3)  
Starting address of register Hi (0)  
Starting address of register Lo (0-61, 128-143)  
No. of words Hi (0)  
No. of words Lo (1-22)  
CRC16 Hi  
CRC16 Lo

**Response:** (from Slave)  
Byte count  
Data 1 Hi  
Data 1 Lo  
Data 2 Hi  
Data 2 Lo  
CRC16 Hi  
CRC16 Lo

**Function 06: Preset Single Register**

**Query:** (from Master)  
Slave address (0-255)  
Function code (6)  
Register address Hi (0)  
Register address Lo (0-61, 128-143)  
Data Hi  
Data Lo  
CRC16 Hi  
CRC16 Lo

**Response:** (from Slave)  

**Function 16: Preset Multiple Registers**

**Query:** (from Master)  
Slave address (0-255)  
Function code (16)  
Starting address of register Hi (0)  
Starting address of register Lo (0-61, 128-143)  
No. of words Hi (0)  
No. of words Lo (1-22)  
Byte count (2-36)  
Data 1 Hi  
Data 1 Lo  
Data 2 Hi  
Data 2 Lo  
CRC16 Hi  
CRC16 Lo
6-2 Exception Responses
If the controller receives a message which contains a corrupted character (parity check error, framing error etc.), or if the CRC16 check fails, the controller ignores the message. However, if the controller receives a syntactically correct message which contains an illegal value, it will send an exception response, consisting of five bytes as follows:

slave address +offset function code + exception code + CRC16 Hi +CRC16 Lo

Where the offset function code is obtained by adding the function code with 128 (ie. function 3 becomes H'83), and the exception code is equal to the value contained in the following table:

<table>
<thead>
<tr>
<th>Exemption Code</th>
<th>Name</th>
<th>Cause</th>
</tr>
</thead>
<tbody>
<tr>

*3: The PROG code is defined by 5.XX, where XX denotes the software version number. For example: PROG=5.10 means the product is TEC-910 with software version 10.

*4: The least significant bit (LSB) of ALM shows the status of output 1. LSB=1 if output 1 is ON (normal condition). The second bit of ALM shows the status of output 2.

## 6-4 Data Conversion

The word data are regarded as unsigned (positive) data in the Modbus message. However, the actual value of the parameter may be a negative value with decimal point. The high/low scale values for each parameter are used for the purpose of such conversion.

Let:  
\[ M = \text{Value of Modbus message} \]
\[ A = \text{Actual value of the parameter} \]
\[ SL = \text{Scale low value of the parameter} \]
\[ SH = \text{Scale high value of the parameter} \]

\[ M = \left( \frac{65535}{SH - SL} \right) \times (A - SL) \]
\[ A = \left( \frac{SH - SL}{65535} \right) \times (M + SL) \]
6-5 Communication Examples:

Example 1: Download the default values via the programming port

The programming port can perform Modbus communications regardless of the incorrect setup values of address, baud, parity, stop bit, etc. It is especially useful during the first time configuration for the controller. The host must be set with 9600 baud rate, 8 data bits, even parity and 1 stop bit.

The Modbus message frame with hexadecimal values is shown as follows:

(1) Unlock the controller

<table>
<thead>
<tr>
<th>Addr.</th>
<th>Func.</th>
<th>Reg. Addr.</th>
<th>CMND=26668</th>
<th>CRC16</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(2) Preset the first group of the parameters

<table>
<thead>
<tr>
<th>Addr.</th>
<th>Func.</th>
<th>Starting Addr.</th>
<th>No. of words</th>
<th>Bytes</th>
<th>INPT=1</th>
<th>UNIT=0</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>01</td>
<td>4E</td>
<td>0F</td>
<td>52</td>
<td>07</td>
<td>1F</td>
</tr>
<tr>
<td>RESO=1</td>
<td>IN.LO=0</td>
<td>IN.HI=100.0</td>
<td>SHIF=0.00</td>
<td>FILT=2</td>
<td>CRC16</td>
<td></td>
</tr>
</tbody>
</table>

(3) Preset the second group of the parameters

<table>
<thead>
<tr>
<th>Addr.</th>
<th>Func.</th>
<th>Starting Addr.</th>
<th>No. of words</th>
<th>Bytes</th>
<th>HSP1=100.0</th>
<th>LSP1=0.0</th>
<th>SP2=90.0</th>
<th>CRC16</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>00</td>
<td>01</td>
<td>00</td>
<td>03</td>
<td>06</td>
<td>52</td>
<td>07</td>
<td>1F</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(4) Preset the third group of the parameters

<table>
<thead>
<tr>
<th>Addr.</th>
<th>Func.</th>
<th>Starting Addr.</th>
<th>No. of words</th>
<th>Bytes</th>
<th>OUT1=2</th>
<th>Reserved</th>
<th>Reserved</th>
<th>01.HY=0.1</th>
<th>CRC16</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>00</td>
<td>11</td>
<td>00</td>
<td>13</td>
<td>26</td>
<td>00</td>
<td>02</td>
<td>00</td>
<td>00</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(5) Preset the rest parameters

<table>
<thead>
<tr>
<th>Addr.</th>
<th>Func.</th>
<th>Starting Addr.</th>
<th>No. of words</th>
<th>Bytes</th>
<th>ADDR=1</th>
<th>BAUD=5</th>
<th>PARI=0</th>
<th>05</th>
<th>00</th>
<th>00</th>
<th>AL.FN=6</th>
<th>AL.MD=0</th>
<th>AL.HY=0.1</th>
<th>AL.FT=1</th>
<th>EIFN=0</th>
<th>DISP=0</th>
<th>CRC16</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>00</td>
<td>28</td>
<td>00</td>
<td>0A</td>
<td>14</td>
<td>00</td>
<td>01</td>
<td>00</td>
<td>00</td>
<td>05</td>
<td>00</td>
<td>00</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Example 2: Read the process value (PV)

Send the following message to the controller via the COMM port or the programming port:

Query

<table>
<thead>
<tr>
<th>Addr.</th>
<th>Func.</th>
<th>Starting Addr.</th>
<th>No. of words</th>
<th>CRC16</th>
</tr>
</thead>
<tbody>
<tr>
<td>03</td>
<td>00</td>
<td>80</td>
<td>00</td>
<td>01</td>
</tr>
</tbody>
</table>

Example 3: Perform reset function (same effect as pressing [REST] key):

Query

<table>
<thead>
<tr>
<th>Addr.</th>
<th>Func.</th>
<th>Starting Addr.</th>
<th>CMND=26661</th>
<th>CRC16</th>
</tr>
</thead>
<tbody>
<tr>
<td>06</td>
<td>00</td>
<td>8E</td>
<td>68</td>
<td>25</td>
</tr>
</tbody>
</table>

Example 4: Read 22 parameters at most one time

Query

<table>
<thead>
<tr>
<th>Addr.</th>
<th>Func.</th>
<th>Starting Addr.</th>
<th>No. of words</th>
<th>CRC16</th>
</tr>
</thead>
<tbody>
<tr>
<td>03</td>
<td></td>
<td>00</td>
<td>16</td>
<td>HI</td>
</tr>
</tbody>
</table>

### Table A.1 Error Codes and Corrective Actions

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Display Symbol</th>
<th>Error Description</th>
<th>Corrective Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>Er 10</td>
<td>Communication error: bad function code</td>
<td>Correct the communication software to meet the protocol requirements.</td>
</tr>
<tr>
<td>11</td>
<td>Er 11</td>
<td>Communication error: register address out of range</td>
<td>Don't issue an over-range register address to the slave.</td>
</tr>
<tr>
<td>14</td>
<td>Er 14</td>
<td>Communication error: attempt to write a read-only data or a protected data</td>
<td>Don't write a read-only data or a protected data to the slave.</td>
</tr>
<tr>
<td>15</td>
<td>Er 15</td>
<td>Communication error: write a value which is out of range to a register</td>
<td>Don't write an over-range data to the slave register.</td>
</tr>
<tr>
<td>39</td>
<td>5En.b</td>
<td>Input sensor break, or input current below 1 mA if 4-20 mA is selected, or input voltage below 0.25V if 1 - 5V is selected</td>
<td>Replace input sensor.</td>
</tr>
<tr>
<td>40</td>
<td>Rd.Er</td>
<td>A to D converter or related component(s) malfunction</td>
<td>Return to factory for repair.</td>
</tr>
</tbody>
</table>
A-2 Warranty

WARRANTY
Tempco Electric Heater Corporation is pleased to offer suggestions on the use of its products. However, Tempco makes no warranties or representations of any sort regarding the fitness for use, or the application of its products by the Purchaser. The selection, application, or use of Tempco products is the Purchaser's responsibility. No claims will be allowed for any damages or losses, whether direct, indirect, incidental, special, or consequential. Specifications are subject to change without notice. In addition, Tempco reserves the right to make changes—without notification to the Purchaser—to materials or processing that do not affect compliance with any applicable specification. TEC Temperature Controllers are warranted to be free from defects in material and workmanship for two (2) years after delivery to the first purchaser for use. Tempco's sole responsibility under this warranty, at Tempco's option, is limited to replacement or repair, free of charge, or refund of purchase price within the warranty period specified. This warranty does not apply to damage resulting from transportation, alteration, misuse, or abuse.

RETURNS
No product returns can be accepted without a completed Return Material Authorization (RMA) form.

TECHNICAL SUPPORT
Technical questions and troubleshooting help is available from Tempco. When calling or writing please give as much background information on the application or process as possible.
